The centre of the long tables in the middle of the hall were beautifully arranged with choice Palms, and Poinsettias, alternately with "breaks" of Orchids, Cyclamens, and other plants; on each side the fruit, which occupied no unimportant part of the exhibition, was staged; and both ends of the principal table were respectively occupied with a choice selection of foliage and flowering plants from Mr. John Cowan, of the Garston Vineyard, and Messrs. R. P. Kerr & Son, of the Aighburth Nurseries, Grassendale. Mr. Cowan's collection, which was neatly and tastefully arranged, consisted of the usual varieties of popular stove and greenhouse plants in nice form for growing on. Messrs. R. P. Kerr & Son's were of a choice character, and were prominent for the grand display of novelties, of which there were many admirers. The arrangement was artistic in itself, and was evidently executed by some one who not only knows the way to grow plants, but to show them also. There were choice Bertolonias exquisitely coloured, Sonerilas, Aralias, Crotons, Dracenas, choice Ferns, and in fine a medley group of rarities, the like of which are seldom exhibited in Liverpool.

Of trained specimens the flowering and foliage plants of Mr. W. Blomley, gr. to Henry Crosfield, Esq., were as usual a long way ahead of anything else; his Bonvardias Vreelandii and elegans were wonderfully well done, the latter being 4 feet 6 inches

in diameter. Mr. Mark Woods also staged a very fine group, which was awarded second honours. This exhibitor had the finest piece of Croton Weismanni we have seen either in or out of London this season. Exotic Ferns were well shown by Mr. Elliott, gr. to W. G. Bateson, Esq., and Mr. Gore, gr. to J. Holder, Esq.

Epiphyllums were well represented in pyramids and umbrella-shaped standards, and, as a class, were good throughout, the best coming from Mr. Tunnington and Mr. Nicholson.

Of fruit the principal prize was for a collection of twelve sorts, for which there were five competitors—Messrs. Mease, Hannigan, and Upjohn being the successful prizetakers. The Grapes from Mr. Mease were very creditable, especially his White Muscats and White Tokay, whilst Mr. Upjohn's Gros Colman and Black Alicante were also fine. The last-named exhibitor showed two bunches of Gros Colman in the class for two bunches of black Grapes, which were perfect in every respect, but were only awarded 2d prize—I suppose, on account of flavour—the 1st prize going to two bunches of Barbarossa, which were small in berry and of straggling habit. Muscat Grapes, as shown by Mr. Nicholson and Mr. Silcock, gr. to Sir Charles Shakerlay, Bart., are worthy of the highest praise, and were beautiful samples after such an untoward season for finishing fruit.

Of hardy fruits there was a grand exhibition, as there always is at Liverpool. Taken as a whole the size, and especially the colour, was something wonderful after we make due allowance for the season, and bearing in mind also that the terms of the schedule stipulate that the fruit shall be grown in Lancashire and Cheshire. Query: did some of the varieties not come from further South?

I suppose enthusiasts in Chrysanthemum culture will consider any report as imperfect that does not contain a list of the varieties that gained 1st honours, and I, therefore, give the names of Mr. Tunnington's prize flowers, other exhibitors showing all or nearly all the same varieties. They are as follows:—Princess of Wales, Prince Alfred, Queen of England, Nil Desperandum, Alfred Salter, Mrs. Heale, Beauty, Jardin des Plantes, Ossian, Empress of India, Mr. Gladstone, White Venus, Cherub, Eve, Prince of Wales, Isabella Bott, and Beethoven.

It may be as well to observe that these remarks must not be taken as emanating from any official source, being simply a few stray notes taken by a Visitor.

Croydon Horticultural: Nov. 22 and 23.—The first autumn exhibition of Chrysanthemums, &c., took place on Thursday and Friday last, at the Public Hall, Croydon, and considering the short notice given of the exhibition the show must be pronounced a success. A fine group of Palms, Tree Ferns, &c., were staged at the end of the hall by Mr. King, gr. to Stephenson Clarke, Esq., Croydon Lodge. Some fine Dracenas, Palms, &c., from the same exhibitor, formed a group for the centre of the hall. The specimen plants of Chrysanthemums, with one or two exceptions, were very poor. The 1st for six large-flowered varieties was taken by Mr. King, gr. to S. Clarke, Esq., as also was the 1st in the corresponding class for six Pompons. In the class for three large-flowered, Mr. Brett, gr. to Mrs. Charlton, Mitcham, was 1st, the same exhibitor also taking 1st for three Pompons.

The classes for cut blooms of the incurved varieties were well filled, some capital blooms being shown. The 1st for twenty-four incurved was taken by Mr. Orchard, gr. to F. W. Harris, Esq., Coombe House, Croydon, with fine-shaped blooms of Queen of England, Jardin des Plantes, Empress of India, Mr. Bunn (a new sport from Golden Beverley, but a brighter yellow), Venus, Lord Derby, Abbé Passaglia, General Bainbrigge, Prince Alfred, Mrs. Dixon, Mrs. G. Rundle, George Glenny, Mr. Gladstone, &c.; Mr. King being 2d. In the class for twelve incurved Mr. Orchard was again 1st, amongst others, staging fine blooms of Empress of India, Queen of England, Jardin des Plantes, and White Venus; Mr. Neale being a good 2d. For six incurved Mr. Chaff, gr. to C. H. Goschen, Esq., Ballards, Addington, was 1st; Mr. Jupp, gr. to Matthew Pratt, Esq., Thornton Heath, 3d, no 2d being awarded. For six cut blooms of Japanese Mr. Neale was 1st, showing among others a fine bloom of Elaine; Mr. Orchard 2d. The large and small Anemone-flowered Chrysanthemums were below the average quality. For twelve large Anemones Mr. Brett was 1st. Mr. Neale was awarded an extra prize for a collection not according to schedule. For twelve Anemone Pompons Mr. Brett was the only exhibitor, and was awarded the 1st prize.

There were a few fine bunches of Grapes shown in the class for three bunches of black, Mr. Chaff and Mr. Stephenson, gr. to F. Peek, Esq., Sydenham Hill, making equal 1st, Mr. Neale being 2d. For three bunches of white Grapes Mr. Chaff was again

1st, and Mr. Charman, jun., 2d. In the class for three dishes of Apples Mr. Chaff was 1st with fine fruits of Cox's Orange Pippin, Golden Noble, and Blenheim Pippin. A prize was offered for three dishes of Peas, but so scarce are they in the neighbourhood that not a single dish was shown. Vegetables were well shown, and made a fine feature in the show. For the three small prizes offered there were eight fine collections staged, being the finest collection of vegetables ever seen at a Croydon show. The awards fell—1st to Mr. Chaff, 2d, Mr. Orchard; 3d, Mr. Brett. Extra prizes were awarded to Mr. King and Mr. Hall, Mr. Cooper being Highly Commended. C. O.

Cheetham Hill, Broughton and Crumpsall Horticultural: Nov. 24.—The seventh annual autumn exhibition in connection with this Society was held on Saturday, November 24, at the school-room of St. Thomas Church, Cheetham. This society, which is now well established, and is every year increasing in favour with the residents of the districts, may be congratulated on the success which has again attended its efforts, the show in all respects being very satisfactory. A very fine lot of large-flowered Chrysanthemums in pots were staged, and among them were some that were remarkably well done; whilst amongst the Pompons, Poinsettias, Primulas, and Roman Hyacinths, were many examples that added considerably to the effect, and when the whole was lighted up with gas, the bright colours of the Epiphyllums and Poinsettias stood out in bold relief. For six exotic Ferns the 1st prize was taken by J. Lunt, gr. to J. B. Mason, Esq., the plants, though not large, were, however, well grown; the 2d prize fell to E. Barron, gr. to E. Muirhead, Esq. Four fine-foliaged plants: the 1st prize in this case was taken by J. Gresty, gr. to J. Kershaw, Esq. For three pans of Roman Hyacinths the 1st was awarded to E. Barron, J. Gresty taking 2d. Primulas were well shown by Mr. J. Rice and A. B. Hastings, the prizes taken in the order named. Mr. Handlay, gr. to Miss Pearson, succeeded in taking 1st with a device suitable for a dinner-table, and which compared with several others was very light and attractive, containing many very choice flowers. For a bride's bouquet and also a hand-bouquet, the 1st prize in both cases was taken by E. Barron, who was also 1st with three Epiphyllums. For four pots of Poinsettias, three plants in an 8-inch pot, the 1st prize was taken by J. Lunt, and were very well done, bracts very numerous and of large size. Mr. Beaver came 2d with a lot equally creditable. For twelve large-flowered Chrysanthemums in pots, the 1st prize fell to A. B. Hastings, who had a very compact well-flowered lot. These averaged scarcely 3 feet high, but were as vigorous and stout as many twice that height. Among them were good examples of Prince of Wales, Elaine, Empress of India, Hero of Stoke Newington, Nil Desperandum, and Barbara. The 2d prize was taken by J. Wood, gr. to R. Jones, Esq., who had a very creditable lot. For six plants the 1st prize was taken by J. Wood, who had fine examples of Dr. Sharpe, Princess Teck, and Mrs. G. Rundle. Mr. Hastings was 2d, who had Josiah Wedgewood in good form. For twelve cut blooms of large-flowered ones Mr. Croft was 1st, among whose lot we observed White Beverley, Golden G. Glenny, Prince Alfred, Mrs. Haliburton, Captivation, Elaine, Blonde Beauty, and Barbara. Mr. Hastings was 2d; he had fine blooms of Mrs. Cullingford, Golden Empress of India, and Hero of Stoke Newington. For six blooms the last-named exhibitor was placed 1st, and also 1st for six pots of White Primulas, he staging double ones in his group. For six Pompons J. Wood was placed 1st, Mr. Hastings 2d. This and another class of Pompons, though well represented, were certainly at a disadvantage, many of the blooms not yet being open, showing how very late these are in many places this year. Some good stands of cut miscellaneous blooms were staged by Mr. Gresty, Mr. Handley, and Mr. Hastings. Mr. Hall, gr. to J. Whitaker, sent some very fine bunches of Grapes, including Muscats and Black Alicante, which were remarkable for size of berry, colour, and general finish. The show remained open till 7 P.M., and was in all respects satisfactory. W. S.

Obituary.

WE regret to record the sudden death of Mr. JAMES BOWIE, foreman in the greenhouse and ornamental department of Messrs. Thomas Kennedy & Co., nurserymen, Dumfries, which took place on the morning of the 21st ult. Mr. Bowie was a native of Cairney, near Huntly, Aberdeenshire, and had been with Messrs. Kennedy & Co. for the last eighteen years. He was well known and much respected, and the news of his death will occasion both surprise and regret to the many warm friends he had made in the district.

Law Notes.

FIRST PROSECUTION UNDER THE ADULTERATION OF SEEDS ACT, 1869.—THE CHARGES.—THE EVIDENCE.—THE CONVICTION.

At the Mansion House, on Monday, November 26, before the Right Hon. the Lord Mayor, at the instance of Mr. ALEXANDER FRANCIS, THOMAS STRANGWAYS, 3, Lawton Road, Mile End Road, appeared to answer a summons under the Seeds Adulteration Act, sec. 3, which charged him with having on October 30, in the City of London, with intent to defraud, sold to Alexander Francis 28 bushels of "killed Charlock," and there was a further summons of a like nature as to a sale on November 2.

Mr. WALTER BEARD, solicitor for the defendant, claimed that there was no jurisdiction, but it being stated that the transactions took place in Mark Lane, Mr. Besley (for the plaintiff) proceeded to open the case.

Mr. BESLEY said this was a very important matter for inquiry, being the first instance in which this Act of the 32d and 33d Vic. had been put into operation. This Act provides that whoever kills—a term defined by the Act as meaning to destroy the vitality of the seeds—or causes to be killed any seeds, or sells or causes to be sold any killed seeds, shall be subject to a penalty not exceeding £5 for a first offence, and for a second or subsequent offence a penalty not exceeding £50. Mr. Besley stated that although the defendant was charged with two offences, it was not desired, this being the first case of the kind, that the amount of the penalty under either summons should exceed the £5 fixed for a first offence, since the two summonses would be decided together; and he remarked that under the Act it was required that any complaint shall be commenced within twenty-one days from the offence, and the magistrate was compelled to adjudicate almost immediately after the offence had been committed. The object of "killing" seed is that the seed may not grow, and therefore may not betray the fraud committed. Charlock is a weed, and if Charlock were to grow in large quantities the farmer would know that the seed sold him was false; but if it were killed, so that it would not grow, then it had been the practice to mix the killed seed sometimes in the proportion of 50 per cent., so that a farmer instead of sowing his field with Turnips, would be sowing a mixture of half-and-half, and his pocket would be defrauded, because he paid for Charlock seed—which if it would grow would be valueless—the same price as for Turnip seed. The killing of the Charlock seed is the first necessity, and he would be able to satisfy the magistrate that in this case the seed was "killed seed." Mr. Besley said that he should show that the defendant deserved no consideration at his Lordship's hands, for previously to the passing of the Act he was well known as a vendor of "killed seeds."

Mr. BEARD appealed to the Lord Mayor that reference to matters antecedent to the dates in the case should not be allowed, but his Lordship ruled that Mr. Besley was in order.

Mr. BESLEY, therefore, proceeded that it was desirable the magistrates should know whether they had before them a person acting in error or designedly, and stated that he would show the defendant had acted designedly, and said as for their Act of Parliament, "I don't care for the Act; I can snap my fingers at their Act of Parliament." First of all, as to the summons in respect of seven sacks of "old Charlock seed." A person of the name of Chapman who is recognised as the agent of the defendant, upon Monday, October 22, offered to Mr. Francis seven sacks of old Charlock "killed," and stated that it was the property of Strangeways, and produced a sample bag of bulk, which bag defendant afterwards handed to Mr. Francis, and that particular sample was in the hands of Chapman, offered by him as "killed" Charlock seed, and the price discussed. On October 26 Chapman again saw him a second time, and purported to communicate the decision of Strangeways, that Mr. Francis must buy the lot or none at all. On the 27th again there was an interview with Chap-

man, at which it was arranged that if delivery was made at the wharf selected by Mr. Francis (Chaplin & Horne's, Trig Wharf) all would be bought by Mr. Francis. On the 29th was the first absolute interview between Strangeways and Mr. Francis in the matter, between half-past 2 and 3 o'clock, and a conversation in which Strangeways fully recognised that Chapman had sold on his account, and he then produced an invoice. After looking at the invoice Mr. Francis said, "Why, there is nothing to fall back upon if the seed should happen to grow." The defendant said "None of it will grow, and if you find a single seed grow I will put the whole lot on the kiln again for nothing." He then produced another sample to effect another sale, offering it at 6s. 6d. per bushel, and an appointment was made by letter in which the seed was referred to by Mr. Francis as "dead seed." On the Tuesday an appointment was made to see him in reference to the first parcel, and 2s. 6d. was then given to Chapman and subsequently another 2s. 6d., he giving a receipt for 5s. as commission—a sufficient authority to make Chapman the agent of the defendant. In accordance with the appointment Mr. Francis went to 3, Lawton Road, Mile End Road, and the transaction was completed. On the 31st there was then a further continuation of the previous offer of 6½ qr. referred to on the second transaction. He made this statement: "When he killed seed, he did not do it as Frith did it. I do it myself, and always carefully scrape the inside of the bags before refilling, so that not a single live seed remains." On that occasion he was pressed to take 6½ qr. of the second parcel and only bought 3 qr. The invoice was made out and paid. Mr. Besley then read letters which had passed between the parties, in which the seed was referred to by the trade mark of three noughts struck through; and said, in conclusion. This is a prosecution by a number of gentlemen who were the promoters of that Act of Parliament, and who desire by the punishment of the practice to put a stop to that which must be a most pernicious thing in reference to the standing of the country and of dealers in seeds. I will put these facts before you, and although the defendant may despise a penalty of £5, the country will be warned, and we may thus be able to put a stop to this very nefarious practice.

THE EVIDENCE.

Mr. ALEXANDER FRANCIS, of Barford Street, Islington, examined by Mr. Besley, deposed:—Was employed by the promoters of the Seed Adulteration Act in this case. On October 22 saw William Chapman at Mark Lane, and he produced the sample bag now in witness's pocket (bag produced). That bag was marked "seven sacks" on one side, and bare other marks on the other side. The marks were in Strangeways' handwriting. Was told by Chapman that the seed was "killed" Charlock seed belonging to Strangeways, and he offered seven sacks at 6s. 6d. per bushel. Witness took away a small quantity, and saw Chapman again on October 26, when he said Strangeways would not divide the quantity.

Mr. BEARD objected that there was as yet no proof of agency on the part of Chapman for Strangeways.

Witness continued.—Gave Chapman 5s., and took his receipt on a card, which he afterwards handed to Strangeways. The payment was for commission on the matter between defendant and witness, and was to be paid by defendant. Was told on the Friday by Chapman that he must take all or none. Saw Chapman again on Saturday, and then arranged that if delivered on Monday he would take the lot of seven sacks. Witness then wrote out the receiving note produced addressed to Chaplin & Horne, at Trig Wharf, authorising them to receive the goods on his account. Saw Chapman again about two o'clock same day, when he said he had sent on the receiving note. On the 29th (Monday), between half-past two and three o'clock, witness saw Strangeways himself at Mark Lane. Neither spoke, but defendant pulled witness by the coat, and witness followed him out round the corner into Mark Lane, and then turned down Hart Street. Conversation commenced when they got round the corner. Defendant said he had brought up the seven sacks that day; witness said "I was at Trig Wharf about an hour ago, and it was not there." Strangeways said, "It has been on the way some time now, it is sure to be there by this;" and he then produced the invoice. (Invoice put in.) Witness' name was not then on the invoice, which was not received. The seed was described as "old Char-

lock" on the invoice. Witness looked at invoice and said, "Old Charlock! We must have an understanding about this, that it does not grow; because if it does, according to this invoice, I shall have nothing to fall back upon." He then tapped me on the shoulder and said, "Well, between man and man, it does not grow—not a seed; if it does, I will put the whole lot on the kiln again for nothing. You know the state of the law; I cannot put anything into writing. You must trust me, and keep your own counsel." Defendant then gave witness the little sample bag marked "seven sacks," which he had seen in the possession of Chapman, and now produced. Strangeways then showed witness a sample of another parcel of 6½ qr. of the same kind of seed (sample produced), and said, "I have another lot of 6½ qr. here, which I have killed for a party in the country, and they have refused to take delivery because the bulk was not equal to sample. £5 expenses have been incurred, but I do not want to fall out with these people because they are very good customers of mine, and, therefore, I should like to sell the seed to somebody else." Witness looked at the sample, and said it was larger in the grain than the previous sample, and defendant said, "Yes, it will do very well if sifted; the larger seed for mixing with Swede, and the smaller with Turnip." Witness then told him he could not do with it at present, but might move it off in a little while, and would see him again shortly. Made an appointment to see him again at half-past 3 that afternoon, but was prevented from keeping it. Sent a letter to Strangeways October 29. (Notice to produce this letter had been served by Ryan, an officer of the Court, but, the original not being produced, copy was put in by the prosecution.) Witness identified the copy, which was read, and referred, in the trade term, three noughts, to killed seed. Went to Strangeways' house on Tuesday, October 30; on the way there had met Chapman at the corner of Hart Street, Mark Lane, and gave him 2s. 6d., and got his receipt for 5s. on the back of a card. Was to get the money from Strangeways. Went to the house and saw Strangeways; said he was sorry he had not kept the appointment, and had come to pay for the seed. Witness said, "I thought you told me that you had sent the seed up to Trig Wharf yesterday. I called this morning and it was not there." Defendant said, "Well, I was very suspicious about you, and did not intend to part with the seed unless I got the money. I had the seed up there in the van, but as you did not come back to pay me, I brought the seed home again. It is now in the yard, and the van has not been unloaded." Witness said, "Well, I will pay you for the seed," and produced the invoice and defendant filled in witness's name, and wrote the receipt. Witness paid him £9 10s. in gold. He said, "We had better go out," and he then changed a sovereign, and handed back to witness the 5s. for Chapman and 1s. change. Witness left Chapman's receipt with defendant. At the time the money was paid, Strangeways called out to his boy, "Tom, go and tell that man to take the seed where I told you?" Witness afterwards saw the seed at Trig Wharf. Just as witness was leaving defendant produced a sample of thirteen sacks, and asked him if he could do anything with it. Witness asked to have the offer of it until the following Thursday, which was agreed to. Defendant said "Very well," and gave him the sample. Whilst with Strangeways he said witness could thoroughly rely upon the seed being "well done; not like Frith's; they shot the seeds on the kiln, and did not scrape the sacks before refilling. I am very careful with the seed. I always scrape the seams of the sacks myself with a small needle, so that there cannot possibly be a single seed remaining in the sacks that will grow." Witness brought away the samples, and on Thursday wrote a letter to Strangeways, and posted it early in the morning. (Copy read, offering to take seed.) Went on Friday to Strangeways' house, and offered to take 2 qrs. first, but eventually closed for 3 qr. Was very much pressed to take the whole parcel, but witness told him he could not do it then. Defendant then wrote out the invoice as now produced, receipted it, and witness paid him £8 in gold. They went to the same house at the corner to get change. Witness had given him the receiving-order on Trig Wharf now produced. Received 4s. back as change. Defendant called the boy and told him to go and take six out of the thirteen sacks, and tell the man to take them to the place where he had the ticket for. Received a

letter on November 8 (produced), believed it to be in the handwriting of Strangeways. Wrote on November 13 as copy produced. It takes about 3 lb. of Turnip seed to sow an acre; a bushel of seed weighs about 52 lb. The first lot of seed was sufficient to sow about 460 acres, and the second about 430 acres—enough "dead" seed, if mixed in the proportion of half-and-half, to sow, say, 1700 acres. Samples handed over for the purpose of testing were drawn from the bulk lying at Trig Wharf. Witness drew the sample from the second parcel, Mr. Ostler drew the other. They were both given to Mr. Charles Sharpe, of Sleaford.

CROSS-EXAMINATION.

Cross-examined by Mr. W. Beard; Not now in business. Had been in the seed trade upwards of fourteen years. Was engaged by Mr. Charles Sharpe, of Sleaford, to investigate and report to him upon the adulteration of seeds. Was in Mr. Sharpe's employ some time. Had not been a principal, but always in the employ of others. Had held situations in Sleaford, Edinburgh, and London.

The LORD MAYOR: That has nothing to do with the case.

Witness continued: Believed when buying these parcels that he was buying "killed" Charlock seed. Only knew by what he was told that it was "killed" seed. Did not, of course, mean to sell it again. The receipt for the first lot was given at Strangeways' house; both receipts were given there. The goods were delivered at Trig Wharf, Upper Thames Street. Would not have thought of selling them again.

JOHN CHARLES OSTLER was next examined. The witness lives at Walthamstow. Took a sample from the seven sacks or first lot, from the bulk at Trig Wharf, and handed the sample to Mr. C. Sharpe.

W. SCOTT, of Trig Wharf, in reply to Mr. Besley, stated that he is manager for Messrs. Chaplin & Horne at Trig Wharf, Upper Thames Street. Had already produced the receiving orders as put in evidence, and had in his capacity of manager received into Trig Wharf the parcels of goods mentioned in those receiving orders. The goods were entered in the housing account, and delivered out to the person on whose account the seed was held. The delivery to the wharf was made by Strangeways for Mr. Francis, and the documents were those produced, with witness's signature thereon.

MR. CHARLES SHARPE, examined by Mr. Besley, stated that he is a seed merchant at Sleaford, in Lincolnshire, and with others had promoted this Act of Parliament which came into operation in May, 1870. There had been no previous prosecution under this Act. It was correct that he had employed Mr. Francis to make the purchases in these cases expressly to obtain a conviction. Had not calculated the area that might be sown with the parcels in question in these cases if mixed in the proportion of half-and-half with other seed. Charlock seed was worth from 3s. 6d. to 4s. per bushel. Charlock seed is used to crush for its oil and for manure, not for the purposes of sowing. There is no genuine use of Charlock seed for sowing; people are too glad to get rid of it. When "killed" it is used for mixing with Swede or Turnip seeds, but has no market value. When "killed" it is not fit for crushing. By "killing" you destroy its manurial qualities, and it becomes of no use whatever except for mixing. Swede seed is worth from 6s. to 7s. or even 8s. per bushel. The trade term for "killed" seed is three noughts. People did not like to speak of "killed" or prepared seed.

In reply to the Lord Mayor, who asked the meaning of the trade term or sign, Mr. Besley said, "Nothing! nothing!! nothing!!!"

Witness continued.—Killed seed has no value whatever. It is only sold for the purpose of mixing with seed of high value. I believe that in former times men were employed in killing seeds who were not experts and did not understand their business, because the seed grew and betrayed the fraud. The samples handed to witness were handed by him to Mr. Marriott, tester in his establishment at Sleaford. Witness kept the two samples and took them home. He knew of his own knowledge that they were killed seeds, because he had crushed them, and they had the appearance of killed seed, and he had sowed them and not a seed germinated.

Cross-examined by Mr. Beard: Was not aware and could not say that "killed" Charlock seed would be sold sometimes mixed up with bird seed—should say not. Should say that people would not

go to the trouble of killing an article that would reduce it in price. Did not know that "dead" Charlock seed was mixed with bird seed. Old Charlock seed if crushed would yield oil. Witness had demonstrated before the Committee of the House of Commons, in the presence of some scientific witnesses, that killed seed could be detected.

JAMES MARROTT, examined by Mr. Besley.—He was tester for Mr. Charles Sharpe at Sleaford, and received from him two samples for careful testing. The samples were numbered respectively 1 and 4. Witness carefully prepared pots, and put into each pot 100 seeds. The samples 1 and 4 were the same as Charles Sharpe had spoken of.

ADMISSION OF GUILT.

At this stage Mr. BEARD said: I think, Mr. Besley, I won't trouble you to produce any more evidence. I think I cannot deny that we have sold this seed to Mr. Francis, and therefore plead guilty to both summonses, but I should ask you as to the question of fraud. He bought it as killed seed, and he says that he did not intend to sell it, therefore no one else could be defrauded.

The LORD MAYOR, referring to the Act, said that under section 5, by which he thought he must construe section 3, under which the summonses had been taken out, it was sufficient that the seed had been "killed" and had been sold as "killed" seed.

Mr. BEARD: I would only say that Mr. Francis was not defrauded; if you take the evidence it is quite certain, I think, that Mr. Francis was not defrauded.

INFLECTION OF PENALTY.

The LORD MAYOR: I inflict the full penalty for each offence and costs.

Mr. BEARD: As this is the first case, I do not think costs—

The LORD MAYOR: It is a very serious matter that the seeds of the country should be adulterated. I inflict the penalty of £5 for each offence—£5 for the offence of killing the seed and £5 for that of selling the killed seed, and £5 5s. costs.

The fines and costs were at once paid.

- Nov. 22.—A fine day. Frequent showers. Strong wind. Gale at 6 A.M.
- 23.—A very fine day. Clear, cold, and windy. Lunar halo at night.
- 24.—Overcast, dull, and wet throughout. Barometer reading at 3 P.M., 29.083 in.; at 7 P.M., 28.891 in.; at 10.30 P.M., 28.971 in.; and at midnight, 29.029 in.
- 25.—A fine day, partially cloudy. Very cold. Barometer reading at 9 A.M., 29.666 in., and steadily rose to 29.823 in. at midnight.
- 26.—Fine, but cloudy till 4 P.M. Overcast, dull, and thin rain fell after. Slight fog in morning.
- 27.—Fine and bright till 3.30 P.M. Overcast and dull with continuous showers of rain after 4 P.M. A little rain fell before 8 A.M.
- 28.—Fine, bright, clear and cold.

LONDON: *Barometer*.—During the week ending Saturday, November 24, in the suburbs of London the reading of the barometer at the level of the sea decreased from 30.30 inches at the beginning of the week to 30.08 inches by the afternoon of the 13th,

increased to 30.11 inches by midnight on the same day, decreased to 29.57 inches by the morning of the 20th, increased to 29.82 inches by the morning of the 21st, decreased to 29.23 inches by the afternoon of the 22d, increased to 29.75 inches by about midnight on the 23d, decreased to 29.07 inches by 7 P.M. on the 24th, and was 29.21 inches at the end of the week. The mean reading for the week at sea level was 29.61 inches, being 0.23 inch below that of the preceding week, and 0.27 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 53° both on the 21st and 22d to 43½° on the 24th; the mean value for the week was 49½°. The lowest temperatures of the air observed by night varied from 33½° on the 19th to 39° on the 18th; the mean for the week was 36°. The mean daily range of temperature in the week was 13½°, the greatest range in the day was 19° on the 21st, and the least 9½° on the 24th. The mean daily temperatures of the air and the departures from their respective averages were as follows:—18th, 45°.2, + 3°.3; 19th, 42°.6, + 0°.8; 20th, 40°.3, — 1°.4; 21st, 43°.9, + 2°.2; 22d, 45°.3, + 3°.6; 23d, 43°.5, + 1°.8; 24th, 39°, — 2°.6°. The mean temperature of the air for the week was 42°.8, being 1°.1 above the average of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 86½° on the 22d, 82° on the 23d, and 80½° on the 20th; on the 24th the reading did not rise above 49°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 29° on the 19th and 24th; the mean reading for the week was 32°.

Wind.—The direction of the wind was mostly from the S.W., and its strength was brisk, particularly on the 22d and 23d days. The weather during the week was fine but cloudy, cool, and showery. A gale of wind prevailed during the 22d and the morning of the 23d. A lunar halo was seen on the 23d. Slight fog prevailed on the 24th.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 56° at Truro, 55½° at Plymouth, and 55° at Cambridge; the highest temperature of the air at Hull was 49°, and at Sunderland 50°; the mean value from all stations was 53½°. The lowest temperatures of the air observed by night were 28° at Wolverhampton, 29° at Hull, 29½° at Nottingham, and 30° at Sheffield and Eccles; the lowest temperatures of the air at Portsmouth was 38°, and at Plymouth 36½°; the mean value from all stations was 32½°. The range of temperature in the week was the greatest at Wolverhampton, 25½°, and the least at Portsmouth and Sunderland, both 15°; the mean range from all stations was 20½°.

The mean of the seven high day temperatures was the highest at Truro, 53°, Plymouth, 52°, and Portsmouth, 51°, and the lowest at Hull, 45½°, and Bradford and Sunderland, both 46½°; the general mean from all stations was 48½°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 32½°, at Nottingham, 33½°, and Leicester, Cambridge, Eccles, and Hull, all 35½°; and the highest at Truro, 42°, and Plymouth 40½°; the mean from all stations was 37°. The mean daily range of temperature in the week was the greatest at Wolverhampton, 15½°, and the least at Sunderland, 7½°; the mean daily range from all stations was 11½°.

The mean temperature of the air for the week from all stations was 42½°, being 1½° lower than the value for the corresponding week in 1876. The highest were 47° at Truro, 46° at Plymouth, and 45½° at Portsmouth; and the lowest were 39½° at Wolverhampton, and 40½° at Hull.

Rain fell to the amount of 2 inches at Brighton, Bristol, and Bradford, whilst at Cambridge and Sunderland four-tenths of an inch only was recorded; the average fall over the country was 1½ inch nearly. The weather during the week was generally fine, but cool and showery. Thunderstorms occurred at Bristol and Bradford on the 22d.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 55° at Paisley to 46° at Glasgow; the mean value from all stations was 49½°. The lowest temperatures of the air varied from 27° at Dundee, and 28° at both Edinburgh and Aberdeen to 34° at Glasgow; the mean value from all stations was 29½°. The mean range of temperature in the week from all stations was 19½°.

The mean temperature of the air for the week from all stations was 40°, being 2° lower than the value for the corresponding week in 1876. The highest was 41°, at Glasgow and Leith, and the lowest 38½°, at Dundee.

Rain.—The amounts of rain measured at the several stations varied from 2 inches and four-tenths at Greenock, and 2 inches and three-tenths at Paisley, to three-quarters of an inch at Glasgow. The average fall over the country was 1 inch and four-tenths.

DUBLIN.—The highest temperature of the air was 54½°, the lowest was 26½°, the range 27½°, the mean 42½°, and the fall of rain 1.04 inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.

216. SEEDLING AMARYLLIS.—Will some of your numerous practical correspondents kindly inform me how long it takes to bloom the Amaryllis from the time of sowing the seed, and under what treatment they will bloom the quickest? *Subscriber.*

Answers to Correspondents.

BRUSSELS SPROUT: *B. T. W.* Your new variety named Welch's Giant appears to be a very good one, but does not display any marked advance on other strains in cultivation.

CLERODENDRONS: *F. A. F. C.* fallax has much larger flowers than *C. squamatum*, with a smaller shorter-toothed calyx. The leaves of the latter plant are covered on the under side with minute flat scales—whence the name.

EXCHANGE: *W. A. E., Kilkenny Castle, Mageny*, writes to say that he has the back numbers of the *Gardeners' Chronicle and Agricultural Gazette* to June, 1873, if any of our correspondents would like to exchange for some other standard work.

FUNGUS: *Alex. Cummings.* The name of the larger Fungus is *Coprinus atramentarius*; the smaller, *Agaricus terreus*. Neither are of any value for the table, though the first is occasionally eaten by enthusiasts.

GRAFTING: *J. P.* You had better get a copy of *The Art of Grafting and Budding*, by Charles Balfet, published at 37, Southampton Street, Covent Garden, W.C.

NARCISUS INJURED BY A GRUB: *A. Your Narcissus* bulbs are irretrievably injured by the grub of the Narcissus fly, *Criaria hina Narcissi*, which was described and illustrated in this journal in 1842 under the name of *Merodon Narcissi*. It is there stated that in the

FIG. 135.—THE NARCISUS FLY.

month of November one or two large roundish holes (fig. 135, a, b) are sometimes found in the outsides of the bulbs of these flowers, which are more or less decayed within, where a maggot will generally be found, which, by feeding on the heart during the summer and autumn months, has been the sole author of the mischief. Towards the end of November the maggot is transformed into a pupa, to accomplish which it eats its way out of the bulb near the roots, b, and buries itself in the surrounding earth, where it remains until the following spring, when the flies issue from their tombs.

HEATING GREENHOUSE: *T. E.* By all means adopt a small hot-water apparatus of light metal, the boiler being placed at one end, inside the house, and being set over a gas burner fixed in an ordinary greenhouse furnace not opening into the house, and provided with a flue pipe to carry off the fumes. As the gas burner can be fixed in any position high or low, you should have little difficulty in arranging a simple apparatus with the hot-water pipes working on the level. You will find this much easier to keep going than one depending on lighting a fire when heat is required.

INSECTS: *E. W.* Aleyrodes Chelidonii or allied species. *I. O. W.—C. R. L.* Your Cineraria leaf is ruined by the larvæ of a minute two-winged fly (*Phytomyza* sp.). We know no other remedy than that of smartly pinching the infested part between the thumb and finger so as to destroy the larva. *I. O. W.*

MYRTLES: *A Constant Subscriber.* Good sandy loam mixed with a little peat or leaf-mould.

NAMES OF PLANTS: *J. M. W.* *Abies Menziesii.*—*W. R. S.* *Myanthus deltoideus.*—*S. E.* The plant with the black berries is the common Buckthorn, *Rhamnus catharticus*; the other is the common Spindle-tree, *Euonymus europæus.*—*W. Crampton.* 1, *Eupatorium Weimmannianum* *alias E. ligustrina*; 2, *Sparmannia africana*. Your specimens were unusually good ones as compared with many that we get.—*W. Howard.* *Astelia Banksii.*—*G. Parrot.* 2, probably *Pyrethrum fruticosum*. Send better specimens.—*Subscriber.* *Tecoma jasminoides.* The *Pelargonium* is not "New Life."—*A. Lee.* 1, *Asplenium marinum*; 2, *Pteris hastata macrophylla*; 3, *Gasteria verrucosa*. The Grape cannot be named from so poor a specimen; possibly it is *Raisin de Calabre.*—*O. S.* 1, *Adiantum pentadactylon*; 2, insufficient; 3, appear to be berries of *Ardisia crenulata.*—*H. C.* *Euonymus*

europæus.—*G. Towill.* *Correa cardinalis*; propagated like other hard-wooded plants, by cuttings.—*Ebor.* *Celsia arcturus*.

TULIPS: *Ella.* Cover them the same as Hyacinths.

VINE DRESSING: *R. E. M., Bristol.* What you call "American blight" is no doubt the mealy bug, a very different insect. Your best plan will be to dress the canes with Gishurst Compound, which, together with instructions for its use, you can obtain from any nurseryman or seedsman.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. *Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

DIED.—On Monday, November 5, at Saint Mary's Hospital, Paddington, EDWARD JAMES DONNAN, eldest surviving son of Mr. Edward Donnan, Castle Bellingham, Co. Louth, Ireland, in his twenty-sixth year, late foreman in The Gardens at Cobham Hall, Gravesend, Kent, the seat of the Earl of Darley.

Markets.

COVENT GARDEN, November 29.

Though trade has been quiet there has been a better demand for home-grown Grapes during the past week, though samples are now confined to the late keeping sorts, such as Alicante, Lady Downe's, and Gros Colman. Pines are still arriving in large quantities from the Azores, and in good condition, but prices are low. Kent Cobs are stagnant. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: Nov. 28.—There is now an improved inquiry for farm seeds, and quotations generally exhibit extreme firmness. White Clovers, in particular, command a strong advance, a good business having been lately done therein. For Alsike, also, full prices are obtained. For both these varieties this year's crops are undoubtedly short, and of inferior quality. As regards red Clover the position remains unchanged. Owing to the abundance and comparative cheapness of French samples, there is no large export movement to this country from the United States. Mail advices just received from Illinois describe many of the parcels then being marketed as somewhat injured by the continued wet weather. Really good French Clover can now be bought in London at from 5s. to 5s. 6c. per cwt. Considering how short will be the supply of English seed these figures, in the opinion of many people, are perfectly safe. The tendency of American Timothy is upwards. In Trefoils there has been no business doing; holders, however, appear confident that still higher rates will prevail next spring. For foreign Italian there is an improved sale, the moderate terms now current having attracted attention. In Rye-grasses there is no alteration. Occasional sales of Canary seed are reported at last week's currencies: some heavy arrivals of this article have been lately reported into Liverpool. For Mustard and Rape seed there is a fair request at previous rates. Linseed, Buckwheat, Peas, &c., are without variation. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Trade was firm at Mark Lane on Monday. As regards Wheat there was invariably an improvement of 1s. per quarter as compared with the rates of the previous Monday. The inferior portion of the English supply was no dearer. Barley was well held, and on the value of grinding parcels there was an advance of quite 1s. per quarter on the week. Malt was quiet on recent terms. Oats were in limited request, and much the same in price. Maize was the turn in favour of the seller. Beans, Peas, and flour were quiet, but steady, small purchases being made at previous quotations.—On Wednesday dealing in Wheat and other descriptions of produce was upon the same limited scale as on Monday; but there being an impression that the lowest point has been about touched, while the weather has a hardening influence rather than otherwise, holders were not disposed to press sales. No change was reported in prices.—Average prices of corn for the week ending November 24:—Wheat, 51s. 5d.; Barley, 44s.; Oats, 24s. 3d. For the corresponding period last year:—Wheat, 47s. 5d.; Barley, 39s. 4d.; Oats, 25s. 9d.

CATTLE.

At the Metropolitan cattle market on Monday there was a larger supply of beasts, but the increase was not so great as was expected, seeing the restrictions on removal of cattle beyond the metropolis are entirely revoked. This circumstance, however, brought together a much larger number of buyers than for a long time past, consequently the trade was more cheerful, with an advance in prices. There was also a few more sheep; and the trade for them was dull, at late quotations. Choice calves were scarce and dearer. Quotations:—Beasts, 4s. 8d. to 5s. 4d., and 5s. 8d. to 6s. 2d.; calves, 5s. to 6s. 4d.; sheep, 5s. 4d. to 5s. 8s., and 6s. 4d. to 7s.; pigs, 4s. to 5s.—Thursday's trade was without great feature. Supplies both of beasts and sheep were about an average for a Thursday, and business was quiet but steady for fine kinds, which maintained Monday's prices. Calves were scarce and dear.

HAY.

Tuesday's Whitechapel report states that good Clover was scarce and firm. Hay and straw, of which the supply was moderate, experienced a dull trade. Quotations:—Prime Clover, 100s. to 140s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 105s.; inferior, 75s. to 85s.; and straw, 44s. to 54s. per load.—On Thursday a large supply of fodder was offered for sale. There was a very dull trade, and prices, although not quoted lower, to effect sales had to be reduced on account of the weather. Prime Clover, 100s. to 140s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 105s.; inferior, 75s. to 85s.; and straw, 44s. to 54s. per load.—Cumberland Market quotations:—Superior meadow hay, 98s. to 110s.; inferior, 80s. to 90s.; superior Clover, 130s. to 140s.; inferior, 105s. to 115s.; and straw, 55s. to 60s. per load.

POTATOS.

The Borough and Spitalfields markets reports state that there prevails a steady demand for the better kinds of Potatos, and prices are fairly supported. Inferior descriptions remain a dull sale. Kent Regents, 160s. to 190s.; flukes, 150s. to 170s.; Victorias, 120s. to 140s. per ton.—The imports into London continue to increase in bulk. In the course of last week 131,418 bags were received from Hamburg, 7584 Bremen, 6758 Antwerp, 1647 Harlingen, 1541 Boulogne, 1564 bags 795 sacks Dunkirk, 1439 bags Brussels, 547 sacks Rouen, 591 bags Rotterdam, and 204 Caen.

COALS.

A good supply of house coals at market on Monday sold at last noted quotations; Hartley's, however, declined 6d. per ton. Prices on Wednesday showed no alterations, and were as follows:—West Hartley, 15s. 9d.; Walls End—Hetton, 20s.; Hetton Lyons, 17s. 9d.; Lambton, 19s. 6d.; Original Hartlepool, 20s.; Tunstall, 17s. 9d.; Chilton, 18s. 9d.; Tees, 19s. 9d.

E. T. ARCHER'S "FRIGI DOMO."—Patronised by Her Majesty the Queen for Windsor Castle and Frogmore Gardens, the late Sir J. Paxton, and the late Professor Lindley, &c.

MADE OF PREPARED HAIR AND WOOL.
A perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. A good covering for pits and Forcing Frames.
PROTECTION from COLD WINDS and MORNING FROSTS.

Improved "FRIGI DOMO" NETTING, 2 yards wide, 1s. 6d. per yard.

THOS. WOLSTENCROFT AND CO., 46, Ludgate Hill, London, E.C.

J. G. WAGSTAFF, Albert Ironworks, Dukinfield.

PATENT PORTABLE SMOKELESS STOVES and PATENT FUEL,

For Heating Conservatories, Greenhouses, Halls, Shops, and Places without Chimneys. The Stoves burn with one supply of Fuel 12 to 24 hours, requiring no attention or re-filling.

NASH'S PATENT PORTABLE VAPOUR BATH and BRONCHITIS KETTLES, with Medical Testimonials.

Fretwork and Carving Tools, Saw Frames, Saws, Patterns, and Prepared Wood, &c.

S. NASH, Tool Warehouse, 119, Newgate Street, E.C., and 233, Oxford Street, London, W. Prospectus free.

AGRICULTURAL LOCOMOTIVES, STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers,

AVELING & PORTER, ROCHESTER, KENT: 72, CANNON ST., LONDON, E.C.: and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES: and at the last trials of the Royal Agricultural Society of Eng' and their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

NOTICE TO THE TRADE. **TEBBS' UNIVERSAL FUMIGATOR** Can be obtained Wholesale of FLANAGAN AND SON, Seedsmen, 95, Cheapside, London, E.C.: and of CORRY AND SOPER, Shad Thames, London, S.E. No one cultivating plants under glass should be without one.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1872, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners! This was THE CHAMPION, Deards' Patent Close-Coil Boiler, for Drawings and Prices of which send two stamps to Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

WANTED, Second-hand 4-INCH HOT-WATER PIPING, for heating Vinery, 50 feet long, with one division and boiler complete.

Mr. HARRIMAN, 107, Grosvenor Road, Pimlico, S.W.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.	To heat of 4-in. Pipe.	Price.
High. 20 in.	18 "	300
20 "	18 "	400
20 "	18 "	500
24 "	24 "	700
24 "	24 "	850
24 "	24 "	1,000
24 "	24 "	1,400
28 "	28 "	1,800

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

MESSINGER & COMPANY, MIDLAND HORTICULTURAL BUILDING & HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH.

Horticultural Buildings erected on Messinger & Co.'s Patent Method of Construction are very strong, most durable, light, elegant, amply ventilated, perfect efficiency for intended purpose is guaranteed, are economical in cost and maintenance; combine the peculiar advantages of Wooden and of Iron Houses, without their disadvantages.

MESSINGER AND CO., from their long experience, and having large Works exclusively devoted to the Construction and Heating of Horticultural Buildings, are in a position to execute with despatch, in the best manner, the Orders with which they are entrusted. Only thoroughly well seasoned timber used.

The Plans of Landscape Gardeners, Architects, and Others carried out. Plans and Estimates forwarded on receipt of Particulars by Post. Ladies and Gentlemen waited upon.

Richly Illustrated CATALOGUE of DESIGNS, taken from Works executed by M. & Co., post-free for thirty-three stamps. Gentlemen consulting this Catalogue have the advantage of inspecting designs whose efficiency has already been tested by experience.

Illustrated CIRCULAR of MESSINGER'S IMPROVED PATENT TUBULAR SADDLE BOILER with Check-end, Hot-water Pipes, Valves, and Novel Plant Protector, sent free.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.

"Royal Exotic Nursery, King's Road, Chelsea, S.W.—Aug. 8, 1877.

"GENTLEMEN.—In reply to your enquiry as to our opinion of your Stevens' Trentham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Trentham Boiler, and we have now thirteen of various sizes at work.

"For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Trentham Boilers supplied by you, and we have never felt so little anxiety in connection with our hot-houses during the cold winter months as we do now.

"We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.

"We are, Gentlemen, yours faithfully,

"JAMES VEITCH AND SONS."

For Illustrations, with full particulars, apply to the Sole Makers,

F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

STOVES, Terra-Cotta! Portable! For Coal! ROBERTS'S PATENT.

Healthy Heat twenty-four hours or longer for about 1d., without attention. For Parlours, Greenhouses, or almost any purpose. Prospectus and authenticated Testimonials sent. In use daily at Patentee's, THOMAS ROBERTS,

112, Victoria Street, Westminster, S.W.

TO NURSERYMEN and SEEDSMEN.—A situation wanted by a young Man (age 19). Five years' experience in all branches.—J. F., Gardeners' Chronicle, Office, W.C.

KINAHAN'S LL WHISKY.

Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

GRATEFUL—COMFORTING.

JAMES EPPS & CO.

HOMŒOPATHIC CHEMISTS.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

Cures of Bronchitis, Asthma, Consumption, and COUGHS, BY

DR. LOCOCK'S PULMONIC WAFERS.—

Mr. CLIFTON, 45, Fleet Street, Bury, writes:—"I have great pleasure in recommending the Wafers, knowing that they are a sure remedy, &c." In asthma, consumption, bronchitis, coughs, colds, instant relief and a rapid cure is given by Dr. LOCOCK'S WAFERS, which taste pleasantly. Sold at 1s. 1/2d.

HOLLOWAY'S OINTMENT and PILLS.

—Self Help.—In sickness it was a momentous matter to find an easy, ready, and reliable remedy for outward disfigurements and inward disorders before the inestimable discovery of these preparations. No invalid need now be at a loss for successfully managing ulcers, sores, tumors, boils, bruises, sprains, &c. Enveloping Holloway's medicine are very intelligible printed directions for using them, which should be attentively studied and immediately followed by the application of his treatment. Sooner or later the sufferer will assuredly triumph over the worst diseases. This searching Ointment disperses all those malignant humours which aggravate many diseases of the skin, often prevent the cicatrization of ulcers, and ever kind inflammatory tendencies in the system.

Now ready, Price 1s., or Free by Post for 1s. 2d., the

GARDENERS' YEAR-BOOK AND ALMANAC FOR 1878.

By ROBERT HOGG, LL.D., F.L.S., Co-Editor of "*The Journal of Horticulture.*"

NINETEENTH YEAR OF PUBLICATION.

"THE GARDENERS' YEAR-BOOK" contains besides the information usually found in Almanacs, a great mass of valuable information, and numerous useful Tables in connection with Horticulture; a Complete Garden Calendar; Notices of all Horticultural, Floricultural, and Pomological Novelties, and a great amount of miscellaneous matter useful to Horticulturists, and

HAS AN IMMENSE CIRCULATION.

"JOURNAL OF HORTICULTURE" OFFICE, 171, FLEET STREET, LONDON, E.C.

THE HORTICULTURAL DIRECTORY FOR 1878.

Head Gardeners who have Changed their Residences since the last Publication are requested to send the Correction to the Editor as early as possible.

To insure insertion Orders and Copy must be received by DECEMBER 10.

"JOURNAL OF HORTICULTURE" OFFICE, 171, FLEET STREET, LONDON, E.C.

PAXTON'S CALENDAR.

Now Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald.*

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's.*

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardeners' Magazine.*

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger.*

Price 3d., Post Free 3½d.

Sutton's Sons

THE QUEEN'S SEEDSMEN, READING.

NEW PLANTS.

MR. WILLIAM BULL
IS NOW SENDING OUT:—

HÆMANTHUS RUPESTRIS.

A new species received from my collector in the West Coast of Africa. Its flowers are bright red, freely produced in dense umbels, the latter 3 to 4 inches in diameter, bracted by three to four oblong-lanceolate reflexing leaves, which are about an inch long; the pedicels are from ½ inch to 1 inch in length. A very desirable introduction, seeing that only a few species of this handsome group of Hæmanthi are at present in cultivation.
Price 10s. 6d. each.

CIBOTIUM MENZIESII.

A fine dwarf-stemmed Tree Fern, inhabiting the Sandwich Islands, long since known to botanists, but only recently introduced into our collections in a living state. The trunk is comparatively stout, densely hair-scaly at the crown. The fronds are, bipinnate, thick, and coriaceous in texture, glabrous, the pinnae large oblong acuminate, pinnatifid, the segments oblong, blunt, almost entire. The base of the frond-stems is densely furnished with a very dark hair-like covering. Mr. William Bull received a First-Class Certificate for this Fern in 1875 from the Royal Horticultural and Royal Botanic Societies. It is closely allied to C. pruinatum, which differs in having the under surface glaucous. C. Menziesii is the same plant as that shown at the recent International Exhibition at Carlisle under the provisional name of C. nigrescens. Only imported trunks can be offered.
Price on application.

CIBOTIUM PRUINATUM.

A noble-looking arborescent Fern, from the Sandwich Islands, very nearly allied to C. Menziesii, from which it differs in the silvery or glaucous under surface of its fronds. It has stoutish stems furnished at the crown with a covering of hair-like dark coloured scales; the fronds are bipinnate, as in C. Menziesii, with comparatively shallow ovate-oblong lobes, but the pinnae and primary pinnules more acuminate; they are smooth on both surfaces; the base of the frond-stems is densely furnished with a dark-brown hair-like covering. This distinct Fern has been awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society. Only imported trunks can be offered.
Price on application.

ANTHURIUM VEITCHII.

An extremely effective and handsome decorative Aroidaceous plant, received by Mr. William Bull from his collector, Mr. Carder, from the United States of Colombia. In the striking character of the leaves principally consists its great beauty; their blades are remarkably long, leathery in texture, and of a bright green; in shape entire, ovate-oblong, and cordate at the base, the two rounded lobes being separated by a funnel-shaped sinus. The young leaves have a glossy metallic hue. The midrib is much thicker near the basal than in the other portions of the leaf; on the upper surface near the base it is rounded, while near the apex it becomes depressed. The spathe is white and oblong; the spadix is scarcely as long as the spathe. This new Aroid has been figured in the *Gardeners' Chronicle*, December, 1876, p. 773, and there fully described by Dr. M. T. Masters, F.R.S., from specimens sent to this country by Mr. Wallis. Fine plants can be offered.
Price on application.

LOMARIA DISCOLOR BIPINNATIFIDA

This beautiful Fern is certainly one of the most handsome of the Lomarias yet introduced. It is of symmetrical habit, its broad sterile fronds rise evenly from the crown, spread outwards in all directions, and arch in an exceedingly graceful manner. Their pinnae are closely set, so that their parts overlap each other, and divided to the mid-rib, the segments being very much toothed and somewhat crisped, which gives the fronds an elegantly fringed appearance. As the plants mature they throw apparently fertile fronds; these, however, in all cases have as yet proved abortive.

This was one of the twelve new plants with which Mr. W. Bull gained the First Prize at the International Horticultural Exhibition held at Dundee in September, 1876.

The specimens offered have been imported from Victoria, and are of various sizes.

Prices of which can be had on application.

TULIPA STELLATA.

A handsome species, collected and sent from the Himalayas. In colour it appears to be variable, for the collector writes some are white, others are white and pink. The specimens sent with the bulbs are white, with a broad distinct stripe of crimson down the centre of three of the petals; these are lanceolate, slightly concave, obtuse, the three outer larger than the rest, and bright yellow at the base within. It is an attractive and handsome species, and will doubtless be a favourite with those who cultivate hardy bulbous plants.
Price, 5s. each.

NEW PLANTS—(Continued).

ÆCHMEA VEITCHII.

This is a very fine new Bromeliad, discovered and sent me from the United States of Colombia by my collector, Mr. Shuttleworth, in 1874, and again found and sent by my collector Mr. Carder, in 1875. Its flowers are produced in a dense oblong head, each subtended by a squarrose bright scarlet horny-toothed bract, the rich colour of which renders the plant highly attractive. Sepals lanceolate-deltoid, bright scarlet in the lower flowers of the head, white in the upper ones. This new plant has been also sent from the United States of Colombia by Mr. Wallis, and has been described and admirably figured in the November number of the *Botanical Magazine*. Mr. Shuttleworth, however, says that in its native habitat the flower-heads are fully double the size of the one figured, and present a most effective appearance, hence doubtless three collectors being struck with it and sending it home.
Price 1½ guinea each.

PAVONIA WIOTII.

A very remarkable Malvaceous plant. Its flowers are very persistent, freely produced, and borne in subterminal corymbs; the bracteoles are of a lively red, long, narrow, and slightly ciliate; the folded corolla is dark purple, from the mouth of which protrude the stamens, crowned with bright blue anthers. Mr. William Bull has received a quantity of this interesting species from his collector in Brazil, and can offer fine imported plants.
Price on application.

NEPHROLEPIS DUFFII.

This may be regarded as a variety of Nephrolepis analogous to the variety of Lady Fern known as Frizellia. The fronds are considerably narrowed, and have a gracefully pendent habit, while the apex is more or less divided in a multifid manner into separate lobes, exactly as occurs in the better forms of the Frizellia type of Athyrium. The plant comes from the South Sea Islands, and was collected by, and is named in compliment to, Mr. Duff, the Superintendent of the Sydney Botanic Gardens.
Price 1½ guinea each.

Establishment for New and Rare Plants,
KING'S ROAD, CHELSEA, LONDON, S.W.

To the Trade.

H. B. SMITH has for Sale a good stock of Short and Half-Standard GLOIRE DE DIJON, Standard and Half-Standard HYBRID PERPETUALS, leading sorts.

PAUL & SON, The "Old" Nurseries, Cheshunt, N.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, December 13, at half-past 12 o'clock precisely, 1200 ODONTOGLOSSUM CRISPUM, just received, ex "Moselle," from the United States of Colombia; among these will doubtless be many beautiful varieties, and most likely a number of the rare O. ANDERSONIANUM, and the still more rare O. CHESTERTONI, several of these two beautiful kinds having bloomed among the previous importation of O. crispum from the same district; and an importation of fine plants of the rare and beautiful ONCIDIUM TETRACOPIS; also an importation, in excellent condition, of the handsome ODONTOGLOSSUM LINDENI. At the same time will be sold some good established Plants of ODONTOGLOSSUM VEXILLARIUM, and various other Orchids.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, December 14, at half-past 12 o'clock precisely, a quantity of extremely choice BULBOUS PLANTS, including several that are quite new to this country; among them TULIPA STELLATA, from the Himalayas; several NEW TULIPS, from Central Asia; IRIS KOLPAKOWSKYANA, a new species from Turkestan, offered for the first time; a new HEMANTHUS, from the West Coast of Africa, offered for the first time; FRITILLARIAS, from California; and a collection of choice LILIES, comprising a large number of the rare LILIUM NEILGHERRENSE, also LILIUM HANSONI, PURPUREUM, HUMBOLDTII, KRAMERI, COLUMBIANUM, and many other choice sorts.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

ESTABLISHED SPECIMEN ORCHIDS.

MR. J. C. STEVENS has received instructions from Messrs. JAMES VEITCH & SONS, of Chelsea, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., without reserve, on THURSDAY, December 20, at half-past 12 o'clock precisely, a selection of choice Specimen and other ORCHIDS, which are being sold only in consequence of their houses being so crowded. Amongst the plants will be found strong CATTLEYAS, of sorts; AERIDES FIELDINGI, very strong; A. VIRENS, a perfect specimen; A. RUBRUM, rare; CYMBIDIUM EBURNEUM; DENDROBIUMS in variety, including the very fine D. BRYMERIANUM, offered for the first time; the fine new hybrid D. AINSWORTHII; LYCASTE SKINNERI ALBA; established plants of ODONTOGLOSSUM ALEXANDRÆ and VEXILLARIUM; VANDA CÆRULEA, strong flowering plants; MASDEVALLIAS, in variety; AERIDES SCHRÖDERI and CRASSIFOLIUM; VANDA CATHCARTII, the finest specimen in the country, and many other fine kinds.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

PHALÆNOPSIS SUMATRANA, VANDA LOWI, CYPRIPEDIUM BOXALLI.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, December 20, at half-past 12 o'clock precisely, good plants of the rare and lovely PHALÆNOPSIS SUMATRANA, P. VIOLACEA, VANDA LOWI, upwards of fifty plants in flower or bud of CYPRIPEDIUM BOXALLI, upwards of fifty plants in flower or bud of ODONTOGLOSSUM CIRRHOSUM, PHALÆNOPSIS SCHILLERIANA and P. AMABILIS, fine strong plants, all with flower-spikes; DENDROBIUM WARDIANUM, with flower-buds, and other choice Orchids.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

SPECIAL ADVANTAGES OF RENDELE'S PATENT System of Glazing.

This system is now being universally adopted by Her Majesty's Government, several of the leading Railway Companies, some of the principal Corporations, including the Metropolitan Board of Works, Commissioners of Sewers, and the New Winter Garden Companies throughout the country.

There is an enormous saving in the Maintenance and Repairs of Roofs on this System—say from 80 to 90 per cent.—and there is no reason why a Roof should not be as perfect in 20 years as the first week, because all the perishable Materials, such as wood, iron or paint, are completely covered by the glass from the destructible influences of the weather.

Another great recommendation is, that there is no breakage from contraction or expansion either from heat or cold, as the glass has full play in every direction. Tens of thousands of squares are broken from this cause every year. Nor is there any breakage from vibration of large Railway Roofs in heavy gales of wind, or from the passing of express or fast trains. Indeed, it is well known that a puttied roof is never perfect in a station where express trains run through.

In adopting this system, all the everlasting expenses of repainting or reputting are completely done away with; and as it is now used by several of the Great Railway Companies, an enormous saving will be effected—it will have a considerable influence in supplying an addition to the yearly dividends.

SUMMARY OF SPECIAL ADVANTAGES.

- 1.—Saving of from 80 to 90 per cent. in maintenance and repairs.
2.—No breakage from contraction or expansion, from heat or frost.
3.—No breakage from vibration caused by heavy winds or passing trains.
4.—Squares of glass can be instantly replaced.
5.—The construction is very strong and durable.
6.—The glass can be put on in one-fourth the time of the old plan.
7.—No drip from condensation.
8.—Putty, cement, felt, &c., are entirely dispensed with.

And One Thousand of the leading County Families in Great Britain and Ireland.

OAKS, English, from 7 to 10 feet, &c.
Prices on application to
HV. MINCHIN, The Nurseries, Hook Norton, Oxon.

THE NURSERY SERIES,

Wandsworth Common, Garratt Lane, and Tooting. The Nurseries comprise 70 Acres of a remarkably useful and well grown stock of HARDY SHRUBS, FRUIT, FOREST, and ORNAMENTAL TREES, CLIMBING PLANTS, &c., especially adapted for planting near London. A personal inspection earnestly solicited. Catalogues free on application to R. AND G. NEAL, Chief Office, Wandsworth Common. The Nurseries are situated one mile from Clapham Junction, on the highroad from Wandsworth to Tooting, and a quarter of a mile from Wandsworth Common Station, London, Brighton, and South Coast Railway.

To the Trade. AGRICULTURAL AND GARDEN SEED. H. AND F. SHARPE'S WHOLESALE AND SPECIAL CATALOGUE OF HOME-GROWN SEEDS is now ready, and will be forwarded on application. Every variety named in it is of the very finest quality in every respect. The prices are very low. Seed Growing Establishment, Wisbech.

Fruit-bearing Trees. FINE STANDARD and PYRAMIDAL PEARS—A large quantity of the above to be sold cheap, the land being required for other purposes. Inspection invited. No reasonable offer refused. All recently removed. JOHN STANDISH AND CO., Royal Nurseries, Ascot, Berks.

To the Trade, &c. LIMES, large Red-twigg'd; Giant and other ELMS; HORSE CHESTNUTS, &c. extra fine, clean, well grown, and well rooted trees, suitable for Street or Avenue Planting, or for Immediate Effect in Parks, &c. Particulars and prices on application to EWING AND CO., The Royal Norfolk Nurseries, Newmarket Road, Eaton, near Norwich.

Special Offer to the Trade. C. DIMMICK AND SONS beg to offer their VICTORIA COS LETUCE, and NONPAREIL RED BETT, in packets to the Trade only. Price will be furnished on application. 146 & 147, High Street, Ryde, Isle of Wight.

FOR SALE.—Standard APPLES, named, 40s. and 60s. per 100; CUPRESSUS LAWSONI, 7 to 9 feet, 24s. and 30s. per dozen; also HOLLIES, ACCUBAS, EUONYMUS, CUPRESSUS, &c., for pots, at very low rates for Cash. J. B. BUTTERFIELD, Nurseries, Baker Street, Enfield.

KENTISH FRUIT TREES.—One of the largest and cheapest stocks in the county, consisting of tall Standard, CHERRIES, Standard, Pyramid, and Espalier APPLES, PEARS, and PLUMS, from 70s. per 100; GOOSE-BERRIES, CURRANTS, &c. CATALOGUES of 300 varieties, including all the heavy and sure croppers suitable for Market Growers. T. EVES, Gravesend Nurseries. Established 1810.

MYROBALAN, or CHERRY PLUM, is the best stuff for Mending Old Fences or Making New Ones. It grows vigorously in the poorest soils, even where Whitethorn will hardly exist, and bears clipping like Whitethorn. Its stiff hard branches, and dangerous spines or thorns, effectually prevent cattle or evil-disposed persons from getting through Fences made of it. Plant from four to six in a yard. Sizes and prices on application to EWING AND COMPANY, The Royal Norfolk Nurseries, Eaton, near Norwich.

MESSRS. CHARLES LEE AND SON, Royal Vineyard Nursery, Hammersmith, London, W., have much pleasure to offer the following very beautiful and interesting NEW FRUITS, now offered by them for the first time:—

RUSSIAN TRANSPARENT APPLE.—In the Journal of Horticulture, December 21, 1876, "J., Lincolnshire," describes this valuable Apple as giving a "never-fading crop," and as being "a rent-paying tree" for cottage gardens. Mr. Beulah, an experienced Lincolnshire Orchardist, confirmed this evidence of the usefulness and profitableness of this much neglected but desirable Apple. A tree that bears a never-fading crop, of excellent quality, as stated below by Dr. Hogg, must be as near perfection as possible, and a desideratum that cannot fail to be appreciated by Orchardists in general. The Russian Transparent Apple was brought from Moscow during Napoleon's campaign in Russia, by General Boucheret, who, noticing its hardiness and free growth, and believing it would be suitable for English gardens, brought a quantity of grafts to his home in North Lincolnshire, round which it became and has remained up to this time localised; and now, through the kindness of Mr. Beulah, we have been enabled to purchase all the available grafts from the original stock.

The following is from Dr. Hogg's description:—"Fruit large, roundish, somewhat oblate, narrowing towards the crown, large, terminates in several prominent ridges, flat at base; skin smooth and shining, grass green, streaked with large russet dots. Eye closed. Flesh very tender and juicy, with a pleasant sub-acid flavour, and a peculiar and agreeable aroma. I am convinced that this is one of the most valuable culinary Apples in cultivation, and is worthy of more than local fame."

Messrs. Charles Lee & Son have much confidence in introducing this desirable and profitable Apple to more extended cultivation. Strong Maiden Plants now ready, price 7s. 6d. each.

HENSON'S SEEDLING GOOSEBERRY.—This excellent variety was figured in the Florist and Pomologist for May, 1874, a First-class Certificate having been awarded to it by the Fruit Committee of the Royal Horticultural Society in 1873. It was described as "a new and distinct variety of exceedingly good quality, of the hairy red section, and a good dessert fruit of medium size."

Messrs. Charles Lee & Son having purchased the entire stock of this valuable Gooseberry, they are now prepared to distribute it to the Public. Price per Plant, 3s. 6d. The usual discount to the Trade.

DICKSON'S "EXQUISITE" MELON.

Awarded a First-class Certificate by the Royal Horticultural Society, November 6, 1877.

FRANCIS & ARTHUR DICKSON & SONS,
106, EASTGATE STREET, AND THE UPTON NURSERIES, CHESTER,

Have much pleasure in announcing that they have received from Mr. TYLER the whole Stock of this, THE FINEST MELON IN EXISTENCE, and they beg to offer it for the first time.

Early Trade Orders are necessary as the Stock is very limited, and only a certain quantity can be offered to the Trade. Wholesale Terms on application.

Retail Price:—Per Packet, 2s. 6d. and 5s.

Description of Exquisite Melon.

"'Exquisite' is one of the deepest-fleshed Melons, the seeds occupying the smallest possible space. The flesh is a beautiful green, moderately firm, yet exceedingly juicy, and ripening well back to the rind, leaving it no thicker than a sixpence. THE FLAVOUR IS, I BELIEVE, UNEQUALLED. Plant vigorous, the original one this year having ripened four crops—in all twenty fruits, which also proves it a remarkably free setter. We are still at this date (December 1), cutting fruits of splendid quality." C. TYLER, Gardener to R. Gosling, Esq., Hassobury, Bishops Stortford.

From Mr. T. SELWOOD, Gardener to His Grace the Duke of Westminster, Eaton Hall, November 29th, 1877.—"One scarcely expects to see Melons so late in the season, much less one so exquisitely flavoured as the one I tasted to-day. I NEVER TASTED SO DELICIOUS A MELON before, not even a 'Colston Bassett,' in July, which previously I had considered the best flavoured Melon. 'Exquisite' is very handsome, beautifully netted, and with an unusually thin rind."

"EXQUISITE" MELON.
(From a Photograph.)

Opinions of the Press.

From the "Gardeners' Chronicle," July 28, 1877.—"Tunbridge Wells Horticultural Society's Show: There was an abundance of Melons—one in particular, a green-fleshed variety, named 'Exquisite,' appeared to have ATTAINED TO PERFECTION in Melons."

From the "Journal of Horticulture," October 4, 1877.—"Mr. C. Tyler, gardener to R. Gosling, Esq., Hassobury, Bishops Stortford, sent a green-fleshed Melon named 'Exquisite.' It was VERY FINE INDEED, and the committee asked to see it again when quite ripe."

From the "Journal of Horticulture," November 8, 1877.—"A green-fleshed Melon named 'Exquisite,' was exhibited by Mr. Tyler. It was, considering the lateness of the season, OF REMARKABLY FINE FLAVOUR. It received a First-class Certificate."

From the "Gardeners' Chronicle," November 10, 1877.—"Mr. C. Tyler again sent a specimen of his seedling green-fleshed Melon, 'Exquisite,' which proved to be of EXCELLENT QUALITY, and was awarded a First-class Certificate."

Seakale, Asparagus and Rhubarb.

CRANSTON'S NURSERIES, KING'S ACRE, HEREFORD

VEITCH'S SELF-PROTECTING AUTUMN BROCCOLI,

AWARDED A

FIRST-CLASS CERTIFICATE

BY THE ROYAL HORTICULTURAL SOCIETY, DECEMBER 4, 1877.

JAMES VEITCH & SONS

DESIRE TO DIRECT ATTENTION TO THIS

VERY VALUABLE BROCCOLI FOR AUTUMN AND EARLY WINTER USE.

The plant is of robust but upright growth, and the heads, which are beautifully white, firm, and compact, are thoroughly protected by the foliage, and remain a long time fit for use. It will be found extremely valuable as a succession to our Autumn Giant Cauliflower, which has met with so much approval, and is now an established favourite in all gardens.

Mr. WESTCOTT, *Gardener, Raby Castle*, says:—"It is evidently a variety distinct from any one I am acquainted with, and from its splendid protecting habit, short and immensely hard woody stem, I am under the impression it will withstand uninjured many degrees of frost, which will ensure it to be a great acquisition as an early winter variety. The plants are of immense strength, and the heads, both in size, texture, and colour, all that can be desired."

Mr. PERRINS, *Gardener, Thornhall Hall*, says:—"It comes in just as the 'Autumn Giant' and other Cauliflowers are going out, and is, therefore, most invaluable. It is quite distinct, and also wonderfully self-protecting; some rows of it at this place withstood 13 degrees of frost."

Mr. THOMAS EADES, *Gardener, The Cedars, Northampton*, writes:—"At our recent show I took first prize for a collection of vegetables containing some really splendid heads of 'Veitch's Self-protecting Autumn Broccoli,' which is the best novelty that has come under my notice for some years."

Extract from *Journal of Horticulture*:—"We have had brought to our notice one of the most perfect self-protecting Broccolis it has ever been our fortune to meet with. So thoroughly self-protecting is it that the beautiful white head is hidden completely in a mass of foliage. It is the model of what a head of Broccoli ought to be—even and solid, of perfect colour, and not more than 4 to 5 inches in diameter—just such an object as families of refinement would like to see on their table."

Extract from the *Gardeners' Chronicle* of December 1, 1877:—"A large breadth of 'Veitch's New Winter-Protecting Broccoli,' now growing in the kitchen garden at Heckfield Place, presents a capital example of the great value of this fine kind as an early winter variety. It makes a good succession to the 'Autumn Giant Cauliflower,' turning-in at the end of November, and will probably continue to furnish a supply for a couple of months. The breadth is marked by singular evenness and truthfulness to character, whilst its protecting character is seen in the fact that the leaves entirely cover and enclose the head of flower. It is a really genuine novelty, that is worthy of all praise and wide cultivation."

Mr. J. SHEPPARD, *Gardener, Woolverston*, writes:—"In this Broccoli we have what has long been wanted, and there will be no difficulty in compassing the whole year through, as it will exactly fill up the void, and last on till Snow's, Backhouse's and others come in."

Mr. MYLES, *Gardener, The Grange, Lamberhurst*, writes:—"I have been cutting for three weeks, and several of the heads weighed 6 lb. when trimmed ready for cooking, and perfectly firm and solid. I have now plenty from that size to the size of a hen's egg, so that I hope to have a supply to the middle of January."

Mr. LESSELS, *Gardener, Aqualate Hall, Newfort*, writes:—"Your Autumn Protecting Broccoli has turned out first-rate with me this season. I am cutting it from 6 to 8 inches in diameter, as close and fine as any Cauliflower: it is a great acquisition."

Per Packet, 1s. 6d.

PRICE TO THE TRADE ON APPLICATION.

STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

TO THE TRADE ONLY.

HURST & SON,
6, LEADENHALL STREET, LONDON, E.C.

The following Peas of Mr. Laxton's raising were sent out by us in 1875, but, in consequence of the failure of the crop, we were unable to supply them last year. We now re-introduce them to notice, as they have proved fully equal to Mr. Laxton's descriptions. Mr. TILLERY, of Welbeck, writing of them says:—"I consider them all well worthy of cultivation, even in the most select collections."

For further particulars of these Peas see "HOGG'S GARDENERS' YEAR BOOK for 1873 and 1874."

THE SHAH.

A short-stawed early white wrinkled marrow of the same height and as early as "Ring-leader," described by the Royal Horticultural Society as having very full pods, produced abundantly, and containing from eight to nine very large Peas of very fine quality, and as being an exceedingly fine and early prolific white wrinkled variety. Received a First-class Certificate.

Per Quart, 5s.

UNIQUE.

A very handsome and prolific dwarf early Pea, with long deep green coloured pods, coming into use same time as "Little Gem." First-class Certificate Royal Horticultural Society.

Per Quart, 5s.

DR. HOGG.

STANDARD.

Unquestionably the most useful maincrop blue wrinkled Pea yet raised, and will take the same place as a prolific market Pea of high quality amongst blue wrinkled marrows, as "Fillbasket" has in round Peas. Described by the Royal Horticultural Society as having long curved pods, containing from nine to eleven Peas of large size and excellent quality in each, and as being a very handsome and prolific Pea. Height 3 feet.

Per Quart, 5s.

CONNOISSEUR.

A most distinct and delicious late Pea, raised from "Ne Plus Ultra." Height 6 feet.

Per Quart, 5s.

Dr. HOGG.

An early "Ne Plus Ultra," coming in one week after "Dillestone's." Height 3 feet. Described by the Royal Horticultural Society as "a very handsome Pea." The earliest green wrinkled marrow, very sweet,

Per Quart, 5s.

and of excellent quality, pods being very well filled and of a beautiful deep green colour like the "Ne Plus Ultra." Awarded a First-class Certificate Royal Horticultural Society.

We have also harvested good crops of the following very excellent varieties, which have proved thoroughly satisfactory during the last few seasons, and we have great confidence in recommending them for extensive planting:—

FILLBASKET PEA:

A dwarf and much improved "Supreme." Height 3 feet, pods long and well filled; exceedingly productive.

SUPPLANTER PEA:

Is an improved stock of "Scimitar," handsome and very prolific, of fine quality, and one week earlier than the old variety.

HURST'S IMPROVED SANGSTER'S No. 1 PEA:

The best and earliest white variety.

MARKET FAVOURITE PEA:

Second early, producing a most abundant crop of large well filled pods—excellent market variety.

DR. Mc LEAN (Turner's) PEA:

The finest of all the wrinkled marrows.

CANADIAN WONDER DWARF BEANS.

SNOW'S WINTER WHITE BROCOLI (true).

VEITCH'S AUTUMN GIANT CAULIFLOWER (true).

FRENCH BREAKFAST RADISH.

RED ITALIAN TRIPOLI ONION (true Genoa saved).

Send for a PRICE LIST of

BLAKE'S SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of
Villages, Irrigation, Railway Stations, Mansions,
Fountains, Farms.

No Cost for Motive Power, which is obtained from the
Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 100,000 Gallons per day.

WILL FORCE TO A HEIGHT OF 1,500 FEET.

This advertisement will appear again in three weeks.

This Ram will raise a part of the same water that works it, or will raise pure water from a well whilst it is worked by a stream of impure water.

TESTIMONIALS.

From the Right Hon. T. SOTHERN ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*

"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful."

(The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

From Captain TOWNSHEND, *Wineham, February 10, 1877.*

"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, and it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000."

From JOHN BARNES, Esq., *Contractor, Chelburn and Helli-field Railway, Contractor's Office, March, 1877.*

"Dear Sir,—I have the pleasure to inform you that the three Hydraulic Rams you erected for me on this contract about two years ago, have continued to work very satisfactorily, without requiring any repairing. With a fall of 5 feet sufficient water has been raised daily by each Ram to supply two of my locomotive engines: they have fully answered my expectations and all that has been said of them."

Deerwater, Wilmslow, November 20, 1873.

"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required, namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—I am, yours truly, L. HANNER."

From Mr. THOMAS MASON, *Alkincoates Hall, Colne, September 30, 1871.*

"Sir,—Your self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours to a height of 194 feet."

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne, December 21, 1868.*

"Sir,—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3500 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

JOHN BLAKE,
ENGINEER, ACCRINGTON.

HARDY TREES AND SHRUBS.

MESSRS. J. VEITCH & SONS

Beg to call attention to and solicit an inspection of their fine and extensive stock of all the most useful Ornamental Hardy Trees and Shrubs, at their Nurseries, Coombe Wood, Kingston Hill.

CONIFERS.

A most complete collection, many of the species and varieties being of their own introduction. Specimens for Lawns, Parks, and Pleasure Grounds. All the kinds suitable for every purpose for which this class of plant is required.

AMERICAN PLANTS.

RHODODENDRONS, AZALEAS, KALMIAS, ANDROMEDAS, HARDY HEATHS, &c.

An exceptionally fine stock of healthy plants, especially recommended as being dwarf, compact, and well set with buds, and in fine condition either for forcing or for pleasure-ground planting.

EVERGREEN SHRUBS.

All the leading kinds, also many rare and choice species of very distinct character, forming a new feature in the Shrubbery. A very large stock of Standard, Pyramid, and Bush Green, Gold, and Silver Variegated Hollies, in great variety and of various sizes.

DECIDUOUS TREES AND FLOWERING SHRUBS.

A very extensive collection, including all the best known kinds, with many novel and interesting varieties. Japanese Acers, Weeping Trees, and other Trees and Shrubs with Variegated and Coloured Foliage.

FOREST TREES,

FOR AVENUES, BELTS, PLANTING, &c.

All the most desirable kinds. Plane, Chestnut, Elm, Lime, Birch, Oak, Maple, and Larch; Pines, Firs, and Cedars.

ROSES.

Strong healthy Plants as Standards, Half-Standards, and Dwarfs, of all the best varieties of Hybrid Perpetuals, Tea-scented and Noisette Roses, Moss, Climbing, and other kinds. An extensive stock in pots of all the best Roses suitable for Forcing, &c.

PLANTS for WINTER BEDDING.

Coniferæ, Retinosporas, Junipers, Lawson's Cypress, &c., in many variegated and beautiful forms; Euonymus and Dwarf Hollies, both Silver and Golden Variegated, in many varieties. Aucubas, Ericas, Dwarf Rhododendrons, &c.

PLANTS for FORCING.

All the most useful and effective, including *Andromeda floribunda*; *Azalea amara*, *pontica* (yellow, sweet-scented), and Belgian varieties; *Clematis* in variety, *Deutzia gracilis*, *Lilac* Charles X. and Persian, *Double Chinese Prunus*, *Rhododendrons*, *R. Early Gem*, very superior; *Rhodora canadensis*, very early; *Spiræa Thunbergii*.

CLIMBING PLANTS,

Well established in Pots.

Clematis, a very extensive collection of all the leading kinds, and of Garden Hybrids. *Ivies* in great variety. Fine healthy Plants of the free flowering Exmouth variety of *Magnolia grandiflora*, *Honeysuckles*, *Jasmines*, *Ampelopsis*, &c.

A CATALOGUE

OF

Hardy Trees and Shrubs, Ornamental Grasses,
Hardy Aquatics, &c.,

Will be forwarded on application.

The Nurseries at Coombe Wood may be reached from the Malden and Norbiton Stations on the South-Western Railway, being not more than twenty minutes' walk from the latter, and where conveyance can always be procured.

Royal Exotic Nursery, King's Road, Chelsea,
LONDON, S.W.,
And Coombe Wood, Kingston Hill.

SATURDAY, DECEMBER 8, 1877.

THE REST OF PLANTS.

THE season is appropriate for considering the question, Do plants ever get tired? It would almost seem so at times. How weary they look, how they droop and flag under the mid-day sun's broad glare. How flaccid and faint they seem after a week's drought or a few days' drying wind. The wind also bruises and batters them so that they exhibit every symptom of fatigue and distress, and make, as it were, mute appeals for rest and shelter in some cosy nook or quiet spot shut in from the scorching sun and parching winds. And then towards the end of the growing season, as it is perhaps erroneously called, plants exhibit almost every symptom of exhaustion. The changes of texture, function, colour of the leaves and flowers, all seem preparatory for rest—a season of repose and time of leisurely balancing up the products of one season's growth and starting for another.

No doubt the rest of plants is not absolute any more than that of animals. At no season, perhaps, from birth to death, is any living thing absolutely at rest. Sleep, the most profound rest of all, only rests certain powers and organs of the body and mind. The vital powers sleep not, rest not. Imagination is probably as active during sleeping as waking hours. The rest of plants is even less complete and absolute, assuming that they do rest. Hardly have the vital powers of plants relaxed into repose than they stiffen again for work. Even the beautiful poetry of the fall of the leaf is a fairy web of fiction, not a record of sober fact. The leaf falls at the summons of advancing life, not at the bidding of death, with its sleep and its rest. Bud growth, like the operations of vital organs, the heart and lungs, &c., is continuous. The buds rest not. Spring does not find them as the autumn leaves them, but far advanced many stations onwards along the line of growth. They may have travelled in winter by the slowest Parliamentary train, and had many stoppages by the slipperiness of the rails and the lowness of the fire, by frost and cold, but still they have made progress. They go by express in the spring. That is the chief difference between bud progress in the two seasons. The rate varies widely, that is all. But possibly the vital power expended in the two seasons may not be so widely different as is generally assumed.

Two or more forces are concerned in all plant growth. They may be broadly defined as internal and external. The one is what, for want of a better name, we term vital force; the other outward conditions. In winter these two are very much pitted, the one against the other, in cold or even temperate climes. At other seasons external conditions foster and strengthen growth. Hence chiefly the difference of the rate of growth. It is quite possible that the plant struggles most to grow when it makes least progress. If so it must needs be a difficult matter to determine at what season plants rest the most. It has been too readily taken for granted that the winter season, or the time of bare boughs, is the proper resting season for deciduous plants. It may or it may not be so, and great practical results depend on the solution of this problem.

It is wise to start with the fact that the rest

of few or no plants—in our climate, at least—is absolute, unless they be succulents, epiphytes, bulbs, or Orchids. But all our fruit and other trees and shrubs, flowers, and most of our cultivated plants rest, if at all, with one eye open. They neither die nor sleep nor hardly rest in the sense of ceasing to grow at any season. The rest of plants is more a change of function and of work than any absolute cessation of motion. The changes are largely determined by the alternations of light and darkness, heat and cold, drought and moisture, and the abundance or scarcity of food. Most of these determining powers in growth or rest are largely in the power of cultivators, and hence the great practical importance of the question.

EFFECT OF LIGHT.

Light is largely beyond our power—the amount of it—the season of it quite so, but not so its admission. The amount of light at our command under glass is largely an affair of horticultural architecture and daily management. The opacity of roofs may be reduced to a minimum, the clearest glass only may be used, and that again may be kept so spotless as to maintain its conducting power at a maximum. Attention to such precautions may double the energy of solar light at the growing season.

Possibly the rest of plants is more a matter of the alternation of light and darkness than is generally supposed. With each such change there is a reversal of function. Broadly stated, exposed to light plants absorb carbonic acid gas and evolve oxygen. In the dark they absorb oxygen and give out carbonic acid gas. From this it has been, perhaps, too hastily assumed that the day is the time for plants to work, night, or in darkness, the season for them to rest. This is a very pretty theory, but there are some awkward facts that seem strongly against it, such for example as that night is often the season when most obvious growth—that is, the greatest extension of parts—is made. To maintain the theory intact some have affirmed that mere extension is not growth, a statement that no practical man will accept, though there may be much truth in it. But be all this as it may the reversal of function or change of labour may prove equivalent to rest; and if so the whole of the plant may be rested every twenty-four hours, or during every succession of darkness after light. Many plants, notably Convolvulaceæ, Sensitive Plants, and many others, either close their flowers or fold their leaves with the decline of the sun or removal of the light. These evidently rest till the light arouses them anew, for it seems almost impossible to conceive of their working to any good purpose in such unworkmanlike positions. But the majority of plants are less demonstrative and rest as they are, or even expanding to fuller size or a richer beauty during the darkness of the night; so that judging by mere appearances some plants would seem to rest by day and others by night. Different principles, or powers, or parts, probably rest at different times. For example, flowers may be chiefly coloured by day, they are assuredly refilled with fragrance at night, the majority of plants will be found far sweeter at midnight than at mid-day, it is so probably with the other functions and secretions of plants. Plant life is less a unity than a community, all the members of which rest and work by turns as the nature and merits of the plants require.

HEAT AND COLD.

Heat and cold are far more in the power of cultivators than light or darkness. Heat is motion or life working in plants—cold, rest or death: that is, if the latter be sufficiently intense, plants must rest—their fluids, on which all their work depends, become congealed into solids, and there is an end of work. Every cultivator, however, knows the extreme danger of forcing rest by frost. In congealing the fluids of growing plants into absolute inaction there is always the danger of rupturing their tissues by the expansion of their fluids in the act of freezing. There is almost equal danger in stimulating life with abnormal activity by an excess of heat. Each plant may be said to have its own thermal place in the

world, and the nearer our practice can approximate to that natural climate, the better for the plants. We may take a useful lesson from lifting-cranes or locomotives in this connection. These are warranted to lift a certain weight, working in safety up to a certain pressure. Each has been tested and proved before being sent out. It is just so with plants. Each has its own place and climatal zone; they were made for it, tried and proved in it, and changes of heat affect them powerfully and if carried to extremes destroy them. Hence whilst cold or a low temperature is a legitimate weapon to use to arrest or moderate growth, or force plants to rest, it needs to be employed with the utmost caution and moderation.

DROUGHT.

Drought is another means of forcing plants to rest. Without a certain amount of moisture any—all growth becomes impossible. This is so obvious as to need no proof, for cultivators are familiar with the power of drought as a means of checking growth either above or below ground. Nature also employs the same power to compel plants to rest in the open air on a larger scale. In tropical climes, where cold is not available as a check to growth, the dry season succeeds the rainy one with the utmost regularity. The plants grow and rest there for so many months or weeks at a stretch. The rest, however, even there, can hardly be termed one of absolute inaction; there is no extension or enlargement of parts, but there may be—there is, in fact—maturation, consolidation. The growth is so excessive during the rainy period that probably a season of forced repose is needful to finish or complete it. Nature, however, also furnishes illustrations of the evils of excessive drought. Many plants are over-dried to such an extent as to be crippled, if not killed outright. The roots and leaves, and also the stems and pseudobulbs, perish, and there is an end of them. The majority, however, pass through the resting, which is also a semi-wasting, period unscathed, the completeness of their rest being to a large extent the measure of their beauty.

It is important to note that the resting period from drought is mostly associated with a high temperature. Much disappointment, many losses have occurred to cultivators by forgetting this. Caladiums, Gesneras, Gloxinias, and other stove bulbs, have been lost by wholesale by attempting to force them to rest dry in a low temperature. Very often, too, the drought has been carried to excess. The plants of temperate climes will not bear so much drought as those of tropical climates. It seems quite a mistake to attempt to force Pines, Peaches, or other fruits to rest by such a degree of drought as is often brought to bear upon their roots. The dryness forcibly arrests growth, no doubt checks the roots, weakens them, and makes them a prey to fungoid growths that weaken and prematurely wreck more fruit trees than all other causes put together. Drought will no doubt force plants to rest, but it should be used with caution, and never to extremes, unless to plants inured to such extremes in their natural habitat. And even in regard to these two extremes, drying off is preferable under cultivation, inasmuch as neither the moisture, heat, nor light is so extreme in degree as in their native climates.

LOW DIET.

Finally, a starving regimen, or the withholding of food, will ensure the rest of plants. Over-feeding is perhaps the most crying evil among plants. Remove a plant from its scanty or full diet in its native position, and feed all alike with almost equally rich food, and overgrowth, with all its evils, are almost sure to follow. The plants should be fed more at one season than another. Plants in a state of Nature are not seldom forced to rest from short supplies of food. The roots have exhausted all within range—the crops of flowers or fruit have used up all forwarded to the front. The plants rest until a fresh fall of leaves enrich the soil, or the roots have run into new feeding places. They then start with fresh vigour. But supposing a dunghill is laid over the roots, or a sewer is turned on to them, would the plants rest? Assuredly not. And it is thus so

much immature wood is formed in glass-houses and open gardens, with pith like Elder boughs, and of which the winter and spring frosts make a greedy meal, instead of assisting the drought and the cold to make them rest well, as the best possible preparation for a safe, pleasant, and profitable awakening. The over-feeding of plants, like the heavy rich suppers of bipeds, induce feverish dreams, late struggles or efforts at growth, not sound, sweet sleep or rest.

Where top-dressing, liquid manure, or rich comforts have been used too freely the shortest cut to forcible healthy rest is through the roots. Thus, though we are neither able to remove the food from the roots nor the roots from the food, we may hinder the latter from overfeeding by judicious and timely root-pruning, and so enforce a period of partial rest by a season of short supplies.

Probably it might be added that perfect maturity is not only a product of the rest of plants but a cause of it. This is, however, doubtful. Perfectly ripe wood and buds are probably inclined to rest and be thankful, then to burst into new life and expand into higher beauty; and so on and on for ever, until they finally rest in the weakness of disease, the chapter of fatal accidents, or the grip of death. F.

New Garden Plants.

CARLUDOVICA DRUDEI, Mast., sp. nov.*

This fine stove-plant was introduced to the nurseries of Mr. Bull by one of his collectors, who met with it in Columbia. Its general appearance is shown in the illustrations (fig. 136, p. 715, and fig. 139, p. 721), from which it will be seen that in habit it resembles a dwarf Fan Palm, with bold very deep green lustrous leaves. The flowers are borne on a stalked erect spadix of cylindrical form and of ivory-white colour, and resembling a bottle-brush by reason of the long barren stamens which project horizontally from the female flowers.

The leaves are tufted, transversely oblong in outline, palmately 3 lobed, the lobes plicated, and deeply and regularly incised at the margin; the central lobe is deeply bifid, so that the leaf appears to be 5-lobed. The leaves are of firm texture, glabrous, rich deep green in colour, and measure about 17 inches in length by 33 inches in transverse diameter. The petioles are sheathing at the base, where they are so arranged as to form a triangular pseudo-stem, invested by a fibrous network as in some Palms, terete above, thickly covered with grey furfuraceous down, and measure about 37 inches in length, the diameter being about that of a swan-quill.

The flowers are borne on an erect terete peduncle less than half the length of the petiole, and terminating in a thick fleshy cream-coloured spadix 4–5 inches long, nearly an inch in diameter, cylindrical, rounded at the end, provided at the base with three or four deciduous boat-shaped fleshy cream-coloured spathe, and covered entirely with flowers, some male, others female. The male flowers are regularly arranged in groups of six (rarely four or five) around each female. The male flowers have a thick flattened wedge-shaped stalk, and a perianth of two rows of small overlapping roundish scales surrounding a cluster of numerous erect stamens with fleshy filaments and two-lobed oblong anthers. The pollen grains are oblong elliptical, with two or more bands, and mixed with needle-shaped raphides. The female flowers consist of a four-lobed perianth, inseparate at the base from the ovary. The staminodes are superposed to the perianth segments, and are very long and threadlike, cream-coloured, and widely spreading. Ultimately they become detached, leaving only a small portion attached to the persistent perianth segment. The ovary is one-celled, with four parietal placentas, and surmounted by a sessile four-rayed stigma. The ovules are very numerous and anatropous. Of the group with palmately-divided leaves, to which the present species belongs, there are but two species, *C. palmata* and *C. incisa*, hitherto described. From the latter, which is imperfectly described (from leaves only) by Wendland, *Index Palm.* 1854, p. 67, our species differs in the leaves not being glaucous, the terete petioles, and in other particulars; from *C. palmata* as figured by Ruiz and Pavon, the very elongate cylindrical spadix, with the male flowers arranged regularly in groups of six around each female flower, and the long spreading nearly straight staminodes distinguish it.

* *Carludovica Drudei*, Mast., sp. nov. — Acaulis; foliis flabellatis 3–5 partitis nitide viridibus glabris; petioliis (metralibus et ultra) ascenduntibus quam folia pedunculique multo longioribus teretibus parce furfuraceis; spatibus 3–5 cymbiformibus deciduis; spadice (12–14 cent. long., 2–3 cent. lat.) crasso cylindrico tereti apice rotundato; floribus masculis circa femineos singulis 6, raro 4 vel 5; floribus femineis staminodiis, perlongis horizontalibus. — E Columbia in hort. Bull introduct.

The London herbaria containing no material sufficient for the identification of the species we availed ourselves of the kindness of Dr. Drude, of Gottingen, at present making a special study of Palms and their allies. That gentleman, with great kindness, compared the drawings made by Mr. Worthington Smith, and our own notes, with the available material at Vienna, from Ruiz and Pavon, Schott, &c., and arrived at the conclusion that the species was new to science. Concurring with his opinion, we do ourselves the pleasure of attaching his name to it.

The species of this genus grown in the Paris garden according to M. Verlot in 1861 were the following:—*C. atrovirens*, Wedl.; *C. bipartita*, Port.; *C. humilis*, Poepp.; *C. incisa*, Wendl.; *C. lanceifolia*, Brongn.;

transverse sections of the spadix, showing the position of the female flowers, with their long false stamens, and surrounded by male flowers; D, male flower at the base of the female flower, the latter seen in section, and magnified three diameters; E, the perianth scales of the male flowers; F, the point of disarticulation of the false stamens; G, section across the female flower; H, stigma; I, stamen, with two perianth scales at the base; K, ovule; L, pollen and raphides, magnified 160 diameters.

THE ROYAL SOCIETY.

ON the 30th ult. the anniversary meeting of the Royal Society was held in accordance with the terms

these organisms are far more favourable than are those of lands a long way to the southward. The flora of the series of channels between 80° and 83° N, the shores of which have been botanised by the officers of the Polar expedition, have yielded upwards of seventy flowering plants and Ferns, which is a much greater number than has been obtained from a similar area among the polar islands to the south-westward, and is unexpectedly large. All are from a much higher latitude than has elsewhere been explored botanically, except the islets of the extreme north of Spitzbergen. The species are, with two single exceptions, all Greenlandic. Spitzbergen, altogether to the

FIG. 136.—CARLUDOVICA DRUDEI.

C. latifolia, Ruiz and Pavon; *C. Liboniana*, Hort.; *C. microcephala*, Hort.; *C. macropoda*, Kletsch; *C. palmata*, Ruiz and Pavon; *C. plicata*, Hort.; *C. purpurata*, Hort.; *S. subcaulis*, Poiteau. Lemaire, *III. Hort.* 1855, mentions some others which are not yet in cultivation.

They may be arranged in two groups according as they have twining stems or are acaulescent (with very contracted stems), and then again according as the leaves are two-lobed or palmately divided. Our present species differs from all that we know of in the cylindrical spathe; but it is certainly very like *C. incisa*, so far as the leaves are concerned. Most of the species are fine decorative stove plants, the present one especially so. *C. palmata*, moreover, is the plant from which the famous Panama hats are made.

References.—A, upper end of spadix, with male and female flowers, natural size; B, C, longitudinal and

of the Charter granted by Charles II. The President, Sir Joseph Hooker, C.B., K.C.S.I., in the course of his address alluded to

THE ARCTIC EXPEDITION,

which he said appeared to have quite come up to our expectations. Considering that but one season was available for collecting and observing (and we all know how short that is in the arctic regions), the results are indeed most creditable to the gentlemen who contributed them. Geology has proved by far the most prolific field of research. Perhaps botany comes next. The researches in this department and the insects, which have been worked up by Mr. M'Lachlan, prove that between 80° and 83° N. in Grinnell's Land, the conditions for the existence of

south of these positions, contains under 100 flowering plants and Ferns, though its west coast is washed by the Gulf Stream, and its shores have been diligently explored by many trained collectors. Its north coast has yielded fewer plants, and no less than fifteen of the plants collected by the expedition have not been found anywhere in Spitzbergen. Contrasted with Melville Island, in lat. 75° N., and Port Kennedy in 72° N., the contrast is even more striking, these well-hunted spots, both so much further south, yielding only sixty-seven and fifty-two species respectively. This extension of the Greenland flora to so very high a latitude can only be accounted for by the influence of warm currents of air, or of the air being warmed by oceanic currents, during some period of the summer; and we look with great interest to the

meteorological observations made during the voyage, which are being discussed by Sir George Nares, who hopes to have it completed in a couple of months. The observations on the temperature of sea-water will, he expects, give new information; and great interest is attached to the study of certain warm gales and warm currents that were experienced in lat. 82° and 83° N. May not these phenomena of vegetation and temperature indicate the existence of large tracts of land clothed with vegetation in the interior of Greenland, far within the mountain ranges of its ice-clad coast, and protected by these from the heavier snow-falls, and hence from the accumulation of glacial ice that surrounds it on all sides?

Professor Heer, of Zurich, has examined the fossil plants, the most important of which are those he states to be of miocene age. There are twenty-five identifiable species, of which all but one have been found also in Spitzbergen. This tracing the miocene flora so far to the northward was one of the principal scientific objects to be accomplished by the Polar Expedition; and the fact that its character continues to be neither polar nor arctic, but temperate, supports the hypothesis that during the æra in question a vegetation analogous to that now inhabiting the temperate latitudes entirely capped the North Polar area of the globe. Sir G. Nares had supplied to the President the following *resumé* of some of the principal meteorological results, and their comparison with those taken at Polaris Bay in 1871-72:—

	Mean Annual Pressure.	Mean Annual Temperature.	Minimum Temperature.
Alert, Floeberg Beach ..	29.869	-3.467	-73.75
Discovery, Discovery Bay ..	29.887	-3.932	-70.8
Polaris Bay	29.970	+4.196	-45.5

Minimum temperature of earth 20 inches beneath surface —3.5°.

The warmer temperature at Floeberg Beach was due to its exposure to the warm winter gales from which Discovery Bay was cut off. The still warmer temperature of Polaris Bay is partly attributable to there being some uncovered water in the neighbourhood. The tidal observations have been entrusted to the Rev. Dr. Houghton, who hopes to present his results before the end of this session of the Society. He has already arrived at the following general conclusions:—1, The tide which comes down Smith's Sound from the north is generically distinct from the Behring's Straits tide and from the Baffin's Bay tide; 2, it must, therefore, be the East Greenland Atlantic tide, and consequently Greenland is an island; 3, this new tide contains a sensible tertio-diurnal component of much interest.

AMERICAN SCIENTIFIC SURVEYS.

After a sketch of the history of the Government surveys, the President continued. The most important scientific results hitherto derived from the labours of Dr. Hayden and his parties are unquestionably the geological: such as the delineation of the boundaries of the cretaceous and tertiary seas and lakes that occupied more than one basin of the mountains of Central North America, and the marvellous accumulation of fossil vertebrates that these ancient shores have yielded. Over an area of many hundred thousand square miles in North America there have been found, within the last very few years, beds of great extent and thickness, of all ages, from the trias onwards, containing the well-preserved remains of so great a multitude of flying, creeping, and walking things, referable to so many orders of plants and animals, and often of such gigantic proportions that the palæontologists of the States, with museums vastly larger than our own, are at a loss for space to exhibit them. So common indeed are some of these remains, and so beautifully preserved, that numbers of them, especially insects, plants, and fishes, are exposed for sale with confectionery and fruit at the stalls of the railway stations, from the eastern base of the Rocky Mountains all the way to California, and are eagerly purchased by travellers. An examination of some of these fossils has yielded the important fact that in North America there is no recognised break between the cretaceous and tertiary beds, a vast lignitic series occupying a position that has long been disputed, and the evidence of whose fossils is very conflicting. In respect of this bed Dr. Hayden, who has traced it over many hundred miles, observes that the character of its palæontological, as well as of its

strictly geological results is such that it is not a matter of importance whether the entire group be placed in the lower tertiary or upper cretaceous; and it is most probable that the testimony of palæontologists will always be as conflicting as it is at present. Professor Marsh, one of the highest authorities in America, has not found that even fossil animals afford a satisfactory solution of the difficulty. "Invertebrate remains," he says, "throw little light on the question;" and he is obliged to assume that "the line, if line there be, must be drawn where the dinosaurs and other mesozoic vertebrates disappear, and are replaced by the mammals, henceforth the dominant type."

FOSSIL BOTANY.

In reference to the disputed horizons of the cretaceous and eocene beds, he concludes that plants afford unsatisfactory measures of geological time—an opinion which I had long ago expressed. We are also agreed as to a chief cause of this being the comparatively low organisation of plants, which are hence less subject to the influences of environing conditions; to which cause might be added, almost as a corollary, the feeble conflict among the members of the vegetable kingdom as compared with the animal, their stationary habits, and that consequent duration of similar, if not identical, forms, through long geological ages, which has always appeared to me to be one of the most signal characteristics of the early condition of the higher plants as compared with the higher animals. Other, and perhaps even more sufficient, reasons for plants being so little satisfactory is that their reproductive organs, those upon which the classification is principally based, are rarely preserved, and seldom in connection with the vegetative organs, which are abundantly preserved; and that with regard to these, the vegetative organs, their prevalent and best preserved characters, outlines and venation, vary in individual species to a surprising degree, and being repeated in groups otherwise in no way related, become too often fallacious guides. Another result, foretold in respect of other organisms, but ably worked out by Professor Marsh in respect of the vertebrates, is that all the tertiary beds of North America—eocene, miocene, and pliocene—are of older date than the corresponding ones in Europe. A few words on the magnificent collection of vegetable remains, cretaceous and others, that have been studied and published by Mr. Leo Lesquereux in various reports of the United States' Geological Survey, and in separate works issued under its auspices, may be fitly spoken here. It would be difficult to over-rate the value of these contributions to fossil botany in the present state of that branch of phytology, which is, unfortunately, a most unsatisfactory one, in so far enabling us to follow the migrations of plants during the tertiary epoch, or by their study to fix with precision the horizons of periods, or trace the devious paths of evolution. In the whole range of the natural sciences none is so difficult, and at the same time unsatisfactory, if we regard the amount of results accepted by botanists as compared with the prodigious labour their acquisition by palæontologists has demanded. Of all the orders of fossil plants of the formations referred to, the gymnosperms alone have, as a rule, yielded much trustworthy information; and this is due to their texture, to the peculiar character of their vegetative and reproductive organs, to the adhesion of these to the branchlets, to their gregarious habits, to their wide distribution, and to their close affinity with existing species. Of other orders and genera of plants, with the exception of a few with well-characterised foliage, as the Palms, the identifications of the majority hitherto published are not recognised by those who have the largest acquaintance with the varied forms of the vegetative organs of plants (such as keepers of herbaria, systematic botanists, and morphologists) as having much claim to confidence. And if the identification of the fossil leaves of one country is so hazardous, what must be that of identifying the fossil leaves of one continent with those of another—a forlorn hope which has constantly to be resorted to? The result, in the case of the North American cretaceous and tertiary floras has been the discovery of certain well ascertained plants, which would appear to show that various prevalent existing American genera have inhabited that continent from a very early period; but that, along with them, there existed types of European, Asiatic, and Australian genera, temperate and tropical, that are no longer associated anywhere on the globe in a state of Nature. It is well, under

such perplexing conditions, that men of ability and unconquerable zeal (such as Heer, Saporta, and Lesquereux) are to be found who will undertake to investigate them; and while thanking them cordially for what they had done, I would urge upon all their association in their labours with the keepers of great herbaria when dealing especially with foliar organs.

GEOGRAPHICAL DISTRIBUTION OF AMERICAN PLANTS.

The results of his personal investigation of the flora of the districts were thus referred to:—Though I have as yet little to say of the results of Dr. Gray's and my own investigations under the survey, I have every reason to hope that, having extended these across the Sink, Salt, or desert regions west of the Rocky Mountains, and thence across the Sierra Nevada to the Pacific coast, they will, with the materials previously obtained by my fellow-traveller and myself, enable us to correlate our several researches into the distribution of North American plants, and to show the lines along which the migrations of the existing types have been directed, and the countries whence they have immigrated. As regards the components of the United States flora, these seemed, to us to be threefold and to be intermixed throughout the continent—an endemic American, a European, and an Asiatic; it seemed that the flora was a ternary compound, so to speak, while that of the temperate Old World was, in a continental point of view, binary, Europe and Asia having many types in common, while neither of them possessed any, or but very few, representatives of the strictly American flora. In respect of the distribution of North American plants, it is in a meridional direction, the difference of the floras of the Eastern, Central, and Western States being wonderfully great—far greater than those of similarly situated regions in the Old World. The European components occupy the whole breadth of the continent of America, diminishing, however, to the westward. The American components present many localised genera, inhabiting the Eastern, Central, and Western States respectively; they increase in numbers and peculiarity towards the west, as also in restriction of range. The Asiatic components are found both in the Eastern and Western States, but hardly at all in the Central; and some of them are common to both the East and West, while others are peculiar to each. But whereas the European components prevail on the side towards Europe, the maximum of Asiatic representation is on that remote from Asia. This has been conspicuously shown by Gray's discovery, in the Eastern States, of single representatives of Japanese genera previously supposed to be monotypic; and what is most noteworthy is, that such representatives are in some cases extremely rare and local plants, found in single and restricted areas, indicating a dying-out of the Asiatic representation in America. The evidences of climatic changes in past epochs of the existing flora of the continent are seen in the prevalence of arctic and northern species of plants in the alpine zones of the meridional mountain-chains, the Appalachian, Rocky Mountains, and Sierra Nevada, even as far south as the 33d parallel. These plants had spread southwards during a period of cold, and on its subsequent mitigation had retired to the lofty situations they now inhabit. To the former existence of a warmer climate we may partly look for the extension of Mexican types to the dry regions west of the Rocky Mountains up to the 41st parallel, and to it may be attributed the remarkable northward extension of the Cacti in a very narrow meridional belt, scarcely 100 miles broad, along the eastern flanks of the same mountains, from their headquarters in New Mexico, in the 33d, almost to the 50th parallel. Of existing influences that determine the development in amount of the vegetation of a country, and the extension in various directions of its components, none are so powerful as the distribution of rainfall and of vapour in the atmosphere. This subject will repay a careful study in America, especially in connection with the presence or absence of woodlands and forests; an excellent map of which, by Professor Brewer, of Newhaven, was published in 1873 by the supreme Government, in which the density of the forests in each State is portrayed by five shades of colour. I must not close my notices of some of the labours of our scientific brethren in the United States without expressing my admiration of the spirit and the manner in which the Government and people have co-operated in making known the physical

and biological features of their country, and my conviction that the results they have given to the world are, whether for magnitude or importance, greater of their kind than have been accomplished within the same time by any people or Governments in the older continents.

THE GENUS AGAVE.

(Continued from p. 683.)

SERIES II.—CARNOSO-CORIACEÆ.—Texture more fleshy and pliable than in the Coriaceo-carnosæ. End-spine not pungent. Teeth never large.

Group VIII. ALOIDÆÆ.—Edge of the leaf furnished with distinct teeth.

The present paper will be devoted to the smaller Aloïdææ with oblanceolate-oblong or lanceolate leaves.

* Leaves oblanceolate-oblong.

81. *A. Bernhardii*, Jacobi, Nachtrage, i., p. 38.—Shortly caulescent. Leaves oblanceolate-oblong, 7 inches long, 3 inches broad at the middle, narrowed to 2½ inches above the base, light bright green, the face rather concave, the chestnut end-spine short and slender, the teeth rather crowded, deltoid-cuspidate, castaneous, fragile, deciduous in the old state, with small ones sometimes interspersed between the large ones. Inflorescence unknown.

A native probably of Mexico. Described by Jacobi about 1868, from a specimen in the Botanic Garden at Leipsic. Not seen in the English collections.

82. *A. (Littæa) rupicola*, Regel; Jacobi, Monogr., pp. 134 and 311.—Shortly caulescent. Leaves about 20 in a rosette, oblanceolate-oblong, 12–15 inches long, 3½–4 inches broad above the middle, narrowed to 2½–3 inches above the base, bright green, 1 inch thick at the base, ½ inch thick in the centre, the end-spine, small and weak, the centre of the face flat, the edge irregularly jagged rather than regularly toothed, the tips of the jags horny and castaneous. Scape 6 feet high. Flowers in a dense spike about 2 feet long, 6–7 inches in diameter when expanded. Perianth, including the ovary, under 2 inches long; ovary oblong, ½ inch; segments oblong, yellowish, as long as the tube. Filaments 2–2½ inches long, inserted at the throat of the tube; anthers ½–¾ inch long. Style nearly as long as the filaments.

A native of Mexico, described by Dr. Regel in 1858 from specimens sent to the St. Petersburg Garden by Karwinski. It flowered at St. Petersburg in the summer of 1863, and is figured at tab. 410 of the *Gartenflora* under the name of *A. densiflora*, Hook. The true plant of that name which belongs to the group Rigidæ, differs by its firmer texture, larger pungent end-spine and regular deltoid teeth. The two may be seen at the present time growing side by side at Kew, and there can be no doubt that they really belong to two different groups, as here defined.

83. *A. (Littæa) Bouchei*, Jacobi, Monogr., p. 120.—Stem reaching 1 foot in length below the rosette. Leaves 20–30 in a rosette, oblanceolate-oblong, 12–18 inches long, 3½–4½ inches broad at the middle, narrowed to 2½–3 inches above the base, bright light green, rather glaucous in a young state, the base 1 inch, the centre ½ inch thick, the brown-black subpungent end-spine about ½ inch long, the brown deltoid teeth crowded and very minute. Scape about 6 feet long. Perianth yellowish-green, under 2 inches long, inclusive of the elliptical ovary; segments as long as the tube. Filaments under 2 inches long; anthers long and narrow. Style 2½ inches long. Capsule oblong; seeds black, semicircular.

A native probably of Mexico. Introduced to the Berlin Gardens in 1861, and flowered there by Inspector Bouche in 1864. I have seen it at Reigate, and there is a small specimen now at Kew.

84. *A. (Littæa) micracantha*, Salm-Dyck; Jacobi, Monogr., p. 135; Baker, in Saund. Ref. Bot., t. 327.—Shortly caulescent. Leaves 20–30 in a rosette, oblanceolate-oblong, 15–18 inches long, 3–4 or even 5 inches broad above the middle, narrowed to 2–3 inches above the base, bright green, the face flattish above the centre, the base ¾ inch, the centre ½–½ inch thick, the end-spine red-brown and moderately firm, the copious close reddish brown deltoid-cuspidate horny teeth about ¼ inch long, the upper ones ascending, the lower deflexed. Barren part of the scape twice as long as the leaves. Flowers in a dense spike 3–4 feet long, 6–7 inches broad when expanded. Bracts red-brown, linear, from a deltoid base. Perianth, 18–20 lines long; ovary oblong, ½–¾ inch long; segments yellowish, spreading, about as long as the tube. Filaments 2 inches long, inserted below the throat of the perianth-tube; anthers ¾–¾ inch long. Style reaching to the top of the anthers.

A native of Mexico, introduced about 1860. It

flowered three times with Mr. Saunders at Reigate about 1870, and a coloured figure will be found in the *Refutium*, as just cited. It may be seen at the present time in all the larger English collections, and is the best known of all the smaller Aloïdææ.

85. *A. (Littæa) mitis*, Hort. Monac.; Salm-Dyck; Jacobi, Monogr., p. 134; Nachtrage, ii., p. 82; tab. nostr. (fig. 137).—Shortly caulescent. Leaves about 30 in a rosette, oblanceolate-oblong, 12–15 inches long, 3 inches broad at the middle, narrowed to 2 inches above the base, bright green, ¾ inch thick at the base, ½ inch thick in the centre, the upper part of the face flat, the end-spine weak, the crowded deltoid teeth about half a line long, either entirely green or only obscurely tinted brown at

FIG. 137.—AGAVE MITIS.

the very tip. Scape about 6 feet high. Flowers in a dense spike 3–4 feet long, 6–7 inches in diameter when expanded. Perianth, including the ¾ inch ovary, 2 inches long; segments under 1 inch long, yellowish. Filaments above 2 inches long; stamens ¾–¾ inch. Style above 3 inches long.

A native of Mexico, introduced about 1860. The inflorescence is described by Jacobi from a plant that flowered at Berlin in 1869. It differs from *micracantha* mainly in the smaller almost colourless teeth, and is probably a variety only. I have seen it both at Reigate and Hammersmith, and there is a small specimen at present at Kew.

FIG. 138.—AGAVE ALBICANS.

86. *A. (Littæa) albicans*, Jacobi, Monogr., p. 137; tab. nostr. (fig. 138); *A. Ousselghemiana*, Jacobi, Nachtrage, i., p. 41; *A. concinna*, Hort. Angl.—Acaulescent. Leaves about 30 in a rosette, oblanceolate-oblong, 12–15 inches long, 3–4 inches broad above the middle, narrowed to 2–2½ inches above the base, persistently glaucous, ¾ inch thick at the base, ½ inch thick in the centre, the face flat above the middle, the end-spine brown, about ½ inch long, the close, deltoid, brown horny teeth under a line long. Barren part of the scape 2 feet long. Flowers in a dense spike, 1½ foot long. Perianth 2 inches long; segments ¾ inch. Filaments above 2 inches long; anthers ¾ inch long. Capsule oblong, ½ inch in diameter; seeds semicircular, black.

A native of Mexico, introduced about 1860. I have seen it in England, both at Hammersmith and Reigate. The inflorescence is described by Jacobi from a plant that flowered about 1867, with Count Kerchove d'Ousselghem. It is scarcely more than a variety of *micracantha*.

87. *A. Thomsoniana*, Jacobi, Monogr., 249.—Acaulescent. Leaves 30–40 in a rosette, oblanceolate-oblong, 12–15 inches long, 3½–4½ inches broad above the middle, narrowed to 2½–3 inches above the base, a very bright green, the base 1 inch, the centre ½ inch thick, the subpungent brown end-spine ½ inch long, the close red-brown horny teeth very irregular, the largest about ½ inch long. Inflorescence unknown.

Described by Jacobi in 1865 from a plant in the Kew collection, imported from San Luis Potosi and named by him in compliment to Dr. Thomson. The plant is still there, and has never flowered.

** Leaves lanceolate.

88. *A. Wallisii*, Jacobi, Nachtrage, ii., p. 78.—Acaulescent. Leaves few, lanceolate, 9–10 inches long, 2 inches broad at the middle, narrowed to 1½ inch above the base, a rather shining slightly primrose-green, the end-spine castaneous, the teeth minute, crowded, deltoid, horny, chestnut-brown. Inflorescence unknown.

A native of Columbia; sent by Gustave Wallis to Linden in 1867. I have not seen it in the English collections.

89. *A. (Littæa) chloracantha*, Salm-Dyck; Jacobi, Monogr., p. 167.—Stem reaching a 1-length of half a foot. Leaves 1 foot long, lanceolate, 2½ inches broad at the middle, narrowed to 1½–1¾ inch above the base, bright green, the end-spine slender, castaneous, the margin minutely serrated, the teeth whitish-green at first, becoming black as they grow old. Scape 5 feet high, with the flowers in a dense spike. Perianth bright green, 1½ inch long. Filaments 2½ inches long. Style falling short of the anthers.

A native probably of Mexico, introduced in 1842. The inflorescence is described by Salm-Dyck in the seventh volume of the *Bouplandia*, p. 73. I have not seen it in the English collections.

90. *A. Brauniana*, Jacobi, Monogr., p. 240.—Nearly stemless. Leaves 30–40 in a rosette, lanceolate, 15–18 inches long, 2½–2¾ inches broad at the middle, narrowed to 1½–1¾ inch above the base, bright green, the face flat in the centre, where it is ½ inch thick, the subpungent chestnut-brown end-spine about ½ inch long, the moderately close deltoid-cuspidate brown teeth ½–1 line long, sometimes confluent into a continuous brown border, the upper ones curved up and the lower ones curved down. Inflorescence unknown.

Described by Jacobi in 1865 from a plant in the Kew collection, imported from San Luis Potosi. It is still there, and has never flowered. This concludes the group Aloïdææ. *J. G. Baker.*

THE SPARKHILL PRIMULAS.

FINDING myself in Birmingham, I felt a great desire to see these Primulas, of which I saw so favourable a notice in last week's *Gardeners' Chronicle*, and your correspondent in no way over-rated their qualities. There is a marked character about them which undoubtedly distinguishes them from other "strains," especially in the thick, sturdy, fine foliage and enormous flowers of thick, waxlike substance.

Princess Louise (or Marchioness of Lorne, its original name), a very fine white, and Marquis of Lorne, a very fine red, were raised at Mr. Tomkins' nursery a few years since. The Marchioness originated from a seedling sport with a compact sturdy habit and stout foliage, which was marked for breeding from, and the two varieties named above were the result of careful crossing. Scarlet King, which is a seedling not yet sent out, is remarkable for its brilliant colour. Mr. Tomkins has made colour his aim for many years, taking for the colour-parent the old *carminata* originally and crossing from his brightest-coloured flowers. The bright-coloured Marquis of Lorne was the result of crossing the white-flowered variety, the Marchioness, with an ordinary red kind, the result of which was a pale-coloured flower, again crossed and recrossed with brighter shades until the result looked for was obtained.

In fern-leaved varieties Mr. Tomkins is doing wonders, the flowers having all the qualities of the preceding and the same sturdy thickness of foliage. Sunrise, a seedling not yet sent out, is of a brilliant rosy salmon colour, very fine indeed; Bride is of a beautiful delicate rosy blush shade, a striking and lovely variety; Monarch has an immense flower, somewhat curled, but of wonderful substance, and, with careful crossing, will be the forerunner of some extraordinary double-flowered kinds. Then there are many other shades of colour, and it is impossible to

predict what, under the careful handling of Mr. Tomkins and his foreman, we shall by-and-bye find in the Chinese Primula.

The difficulty in the way of the general cultivation of these grand varieties lies in the scarcity of seed they produce, for they are so highly bred that very little seed can be obtained from them; and to get even this the camel's-hair pencil has to be freely used. They come quite true from seed, and it is as well here to caution others that it is of no use substituting seed of ordinary strains for this, because their sin is sure to be found out, as they form a thoroughly distinct type from the ordinary "strains" advertised. They can, however, be easily propagated and perpetuated, and bloom as freely and well from cuttings as from seed, and I will presently give details as to culture.

To Mr. Frederick Rose (everybody about Birmingham knows him as Fred), who for twelve years has been Mr. Tomkins' right-hand man, great credit is due for the manner in which he cultivates this plant and his persevering energy in improving the varieties. Nor do they confine their attention to single kinds only, but several very fine double kinds have originated here, and the cry is still they come. There is now in bloom a very handsome double kind, just christened *Ilacina grandiflora*, of quite a new shade of colour; Queen of Roses is also another beautiful recently named seedling, which is very bright in its colour and of fine form. *Alba magnifica* won its laurels from the Royal Horticultural Society some time since, and is one of our finest doubles; while Emperor, a bright rosy fern-leaved variety, extra fine; and Magenta Queen, pale magenta and very fine, two of Henderson's best kinds, are in fine character, and so also is Smith's *rubra grandiflora*, a fine bright rosy purple variety.

The system of culture practised at the Sparkhill Nurseries is one easy to follow, and it is this:—The compost used is a mixture of burnt earth, stiff loam, old mortar, charcoal, very rotten cow-dung and leaf-soil, well mixed together, the roots having a great liking for the pieces of mortar and charcoal, and this compost does not necessitate much drainage, as it is sufficiently porous in itself. Mr. Rose recommends the crowns to be kept low down in the soil in potting, as he finds that they throw out a great many surface-roots, which add much to the vigour of the plants. Seed is sown from March until May so as to insure a succession, the earliest batch of course for the earliest bloom. Cuttings are struck in the spring in a gentle bottom-heat. The plants are grown in a low span-roof house, with side ventilation as well as at the top, and in brilliant weather the light is subdued by a little shading. Too much exposure is carefully avoided, and careful watering is essential. Tepid water is always used, watering over the foliage until the plants begin to flower. Manure-water is used most carefully, for the roots are so sensitive that mischief is soon done from an overdose. It is used frequently at Sparkhill, but very weak, and always with tepid water. Primulas are grown extensively here, for the flowers of the double kinds are in great request for buttonhole flowers. A visit to the nurseries will, moreover, give practical evidence that Primulas are well grown here under somewhat adverse circumstances, as the Birmingham district is not remarkable for its clear, bright day atmosphere throughout the autumn and winter months. In order to show you that the varieties really deserve the celebrity they have, flowers and foliage of some of the kinds are sent to you that you may see what they are. B. C. [Very fine indeed. Eds.]

THE SOCIETY OF PAINTERS IN WATER COLOURS.

THE sixteenth winter exhibition of this Society opened to the public on Monday last. The collection of pictures is one of the best we have ever seen in the Society's rooms, though it must be confessed that this particular exhibition appears every year to depart more and more from its programme, which indicates an exhibition of "sketches and studies" only. Each December one sees a large number of highly-finished water-colour pictures in these rooms mingled with about an equal number of more roughly executed works. We never remember having seen a better collection of landscape paintings in water colours, but they are too numerous for us to mention in succession, as views of meadows, woods, mountains, sky and sea are dotted all over the walls of the exhibition

room. 12, The Teme at Ludlow, George P. Boyce, is correct, but presents in dirty colours the beautiful Teme in its dullest and most uninteresting aspect: the same criticism holds good of nearly all Mr. Boyce's pictures—even in the Venetian scene, 197, the sky is painted dull indigo. When the Woolhopeans were at Ludlow one dull October day, a year or two ago, an artist was espied in the middle of a scrubby field (with his back to the magnificent castle) apparently very busy painting nothing. From the nature of the spot and the day one of the fungologists declared the artist must be Boyce; and judging from the Ludlow pictures in the present exhibition, the guesser was probably not far wrong. 13, Lac de Combal, south side of Mont Blanc, W. Collingwood, is remarkable for the natural effect of the storm-clouds with the descending lightning. 15, A Caravan Overtaken by a Sand-storm near the Pyramid of Geezeh, E. A. Goodal, is an excellent picture of a storm of sand, but the pyramids lean over to one side. 18, A Root of Celandine, Maria Harrison, is a sketch of average quality, but with little character, of a plant of *Ranunculus Ficaria*: the root is introduced in the catalogue with eight well-known lines from Wordsworth. 29, Okehampton from the East, David Cox, jun., is a harvest scene, with a rainy "Coxean" sky. Regardless of the rain two rustics are sitting down courting by the corn in the foreground. 59, one of a series of nameless figure and landscape subjects, by J. D. Watson, is remarkable for its excellent drawing and rich harmonious colour. The subject represents a bevy of healthy country girls snowballing a jester in a field where the snow lies thick. 81, A Branch of Red Roses, Maria Harrison, represents a couple of ill-grown Roses and some weather-beaten, colourless, ragged leaves. The picture quite fails to give any idea of the true character of a Rose or its foliage. 110, Edward the Confessor's Chapel, Westminster Abbey, 1852, George P. Boyce: we stop at this elaborate picture to note its extraordinary beauty and correctness of drawing. It is dated 1852-73: this can mean no other than that the picture remained unfinished for twenty-one years. The architecture and perspective is photographically perfect, but architecture and perspective (in buildings) are always perfect with Mr. Boyce (see 124, The Church and Back of an Old House at Ludlow). 115, The Route, Sir John Gilbert, R.A., occupies the position of honour, and displays all the bold and dashing qualities of this admirable painter. 119, The Earth Taking Refreshment, Albert Goodwin, is a remarkable picture on account of the natural effect of a local and heavy downpour of rain on a quiet day in the country. 119, The Gardener's Cottage, a Study in Sussex, Josh. J. Jenkins, is an excellent picture, well drawn and painted, of a gardener in a green (not blue) apron, attending to the plants near his own cottage; the latter is covered with *Clematis Jackmanni*, in the foreground are well-painted *Pelargoniums* and other plants. 225, Spring-time, Bird's-nest and Apple-blossom, Maria Harrison, tolerably well sketched; but how many times too often has the same subject been painted before. 259, Study for a Panel, by the same artist, represents a plant of *Richardia athiopica*, but it gives no idea of the handsome character, grace, and colour of the real plant. 268, Unfinished Sketch of the Old-fashioned Cabbage Rose, by the same artist, is far better than this artist's other efforts. 299, An Evening in July, E. K. Johnson, is a beautiful garden scene in the twilight, and is notable for the correct drawing and painting of the Roses, Violets, and Pansies. 286, A Study—Cabbages, J. Parker, a group of Cabbages growing in a garden, is very correct in drawing and colour. 300, Finished study for exhibited drawing—Winter Twilight, C. Branwhite, arrests attention on account of its bold true drawing, and its rich and beautiful colour. 322, Great Expectations, E. K. Johnson, represents two figures in a spring orchard where blossoming Apple and other fruit trees are admirably painted. 329, Marigolds, J. Parker, is a small but most truthful painting of Marigolds set off to their fullest advantage by a purple-blue vase. 334, Roses, by the same artist, is a good picture, but the Roses are uncommonly bad and ill-grown varieties. 337, a study made in a garden of standard Roses, Maria Harrison, is as unsatisfactory and formal a picture of Roses as could be conceived. 342, Water Lilies, J. Parker, an uncommonly bold and good sketch of white Water Lilies growing in a pool. 394, Flora, L. Alma Tadema, A.R.A., is one of this artist's excellently painted classical subjects. It represents a youthful

female figure, clad in blue, stooping down to gather Anemones. In the background is a strong burst of light falling on a path in the Anemone-dotted grass, and a white marble fountain. 427, The Blush Rose, Maria Harrison: in addition to the Blush Rose there is an unhappy spray of *Begonia* together with a few white Grapes: dewdrops, too, are introduced. As a rule we are prejudiced against dewdrops, for we have observed that painters who fail with fruits, flowers, and foliage, too often have a faculty of studding these organisms with anything but natural drops of moisture.

Notices of Books.

The Forest and Chase of Malvern, &c By Edwin Lees, F.L.S. Worcester Herald Office, 1877.

Mr. Edwin Lees has reprinted from the *Transactions of the Malvern Naturalist's Field Club* his account of the forest and chase of Malvern, with notices of the most remarkable old trees within its confines. Beginning with a brief historical sketch, in which the distinction between a forest and a chase is pointed out—the former being Royal property, the latter could be held by a subject—Mr. Lees proceeds to tell of the forest laws and customs, such as those which are the plague of foresters and forest conservators. The meaning of the term "humble" or "humble pie" will be probably new to many readers. Mr. Lees' account is that "it has been generally said that humble pie was a dish made from the entrails of deer, and only served to those who sat at the lower end of the great table in the hall in the 'good old time.'" The "hombing of dogs" was a less pleasant process for the poor animals: "such manner of dogs as were found unlawful, that is to say as could not be drawn through a certain stero of 18 inches and a barleycorn in length and breadth compass, the farther joints of the two middle claws were to be cut clean away, and the master and owner of the dog were to be amerced 3s. 1d." Notes on the natural history, and especially of the old trees of the district, naturally follow. Oaks with variegated leaves occasionally occur, and were considered to be curiosities and prodigies with which superstitious beliefs were connected. "Some are of opinion," says Heath in his *History of Cornwall*, "that divers ancient families of England are pre-adornished by Oaks bearing strange leaves." Referring to the Pear orchards of Worcestershire, Mr. Lees writes that no historical evidence of their existence prior to the time of Drayton (temp. Henry V.) exists, but as that poet alludes to the banner borne by the Worcestershire men at Agincourt, as having for its device "a Pear tree laden with its fruit," it must needs be that the Pear orchards had already assumed considerable importance. A slight account of the remarkable Barland Pear orchard is given—a sight that is well calculated to impress a stranger, and to astonish those accustomed to see Pears trained on walls, or at most as pyramids. To see Pear trees as big as Oaks, with boles 14 to 20 feet in girth at a yard from the ground, and with a spread of branch sometimes equal to 100 yards in circuit, is a new sensation. The crop appears to be a very variable and precarious one, for whereas in favourable years one orchard has yielded 200 hogsheads of perry, in another season the produce has only been three hogsheads. That some quantities are required is evident from the statement that at harvest time "the claim of the labourer to his stipulated dozen or more quarts (of cider or perry) per diem being never abated, but added to if possible." We have said enough to show that Mr. Lees' little book is both entertaining to the general reader and valuable to the natural historian of our country districts.

The last fascicle of the *Flora Brasiliensis* contains a monograph of the *Lythracæ* by Dr. Koehne, of Berlin. The greater portion is taken up with the genus *Cuphea*, which is very largely represented in Brazil, and several species of which are highly ornamental. The coloured calyx of these plants is gibbous at the base, the stamen or stamens are suppressed in the same side of the flower, but at the base of the ovary is a nectariferous gland also on the side next the spur. The object of this arrangement is obvious. In some of the species, as the fruit ripens, the placenta escapes through a chink in the capsule, and becomes sharply reflexed, leaving the seeds exposed to the air.

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—That most acceptable winter-flowering hard-wooded plant, *Daphne indica*, where the bloom is wanted as soon as may be, should occupy a position a little warmer than an ordinary greenhouse, say 45° in the night. Here, if the plants have been so treated as to induce an early growth, they will come into flower without anything approaching a forcing temperature which it is well to avoid. One of the most effective plants that have ever been introduced to this country is the Australian *Clianthus Dampieri*; its singularly formed and still more distinct coloured, black and crimson flowers, are always a source of attraction, especially in the conservatory, where it is a fitting subject to mix with other things of a more everyday character, and yet it is comparatively seldom seen, no doubt through the fact that it will not conform to the treatment by which most things can be made to succeed. Two essential points in its cultivation are, to grow it on the one-shift system, as its roots will not bear the slightest disturbance, such as is unavoidable in repotting even with the greatest care, and it likes to be kept a little warmer through the winter than ordinary greenhouse stock; 45° during night, with a proportionate rise in the day, I have found answer best for it, keeping the soil and atmosphere moderately moist.

Camellias.—Where these are at all backward and yet wanted in flower as soon as possible, their blooming may be accelerated by placing them in a temperature of from 45° to 50° in the night, but anything in the shape of forcing must be avoided, and where fire-heat at all is used the atmosphere must be supplied by some means with a sufficient and continuous amount of moisture, otherwise the buds will be liable to drop off.

SOFT-WOODED GREENHOUSE PLANTS.—*Imatophyllums.*—These stately and free-flowering plants are so accommodating that they will grow in almost any temperature, but in no way are they more useful than to come in further on in the season than if subjected to more warmth, which they will do if now kept from 45° to 50° in the night. If several plants are grown, and some kept quite cool, these again will come later still, keeping up a succession for months. Where *Cinerarias* were sown early, and the plants subsequently received the requisite attention, their flower-stems will now have made considerable progress. The blue forms afford a colour acceptable for cutting, and where it is desirable to have them in bloom with the least delay they should be kept in a temperature of 45° at night, but no attempt at forcing should be made, as they are ill-calculated to bear it. If a pit or small house can be devoted to these and things of similar character it is a great boon to those who have large quantities of flowers to supply; and even in the case of such plants as have ultimately to be subjected to a still higher temperature the effect of thus gradually keeping them slowly moving is a decided advantage over at once removing them from a comparatively cool to a higher temperature. **Chrysanthemums.**—It often happens that plants that are exceptionally easy to cultivate are indifferently managed. There is no plant probably of which this holds true more than the *Chrysanthemum*; not only is it the freest of free growers, but it is so manageable in the matter of propagation that cuttings will root at any time of the year when they can be obtained. Many put off striking cuttings until spring, but there are several disadvantages connected with this delay; the first is that it entails the necessity of wintering the old plants in pits or frames, which thus are unnecessarily occupied by them, and the cuttings from plants so wintered are frequently in a weak, unsatisfactory condition, whereas if they are taken off during the present month, whilst the plants are in flower, or have just completed their blooming, they can be either thrown away or turned out of the pots and heeled-in out-of-doors, or at once planted where they are to remain, if required for such purpose. But this is not the whole gain; by timely propagation the wood of the plants struck early gets better solidified before the time the buds set towards the close of the ensuing summer, and will produce a larger number of perfect flowers than obtainable from softer later struck plants. This is more apparent in some kinds than others, but that such is the case I have proved several times by actual experiment. Cuttings put in now half-a-dozen together in 3-inch pots, or, proportionately more, in such as are a little larger in free sandy soil, and covered with hand or bell-glasses stood upon the front shelf of a greenhouse or the floor of a vinery, keeping them moist, but giving a little air by tilting the glasses that cover them just so as to prevent damping, will root in a few weeks, after which they can be moved singly into small pots. The extraordinary examples of individual flowers seen at the exhibitions have been the means of casting in the background many of the best varieties for general decorative purposes, that is those that attain a

medium size, the plants possessing a natural ability to perfect a much greater number of flowers than the generality of the show varieties that individually attain a large size. In this some of those with reflexed petals are much superior to the majority of the incurved kinds, though this does not in all cases hold good. The medium-sized white *Mrs. George Rundle* is probably the best decorative *Chrysanthemum* in existence; the pale yellow sport from it, *George Glenny*, is an exact counterpart in everything but colour. Amongst old kinds that for general effect are equalled by few may be named *Annie Salter*, sulphur-yellow; *Orange Annie Salter*, a sport from the original; *Florence Nightingale*, white, shaded with sulphur; *Hermine*, blush, tipped with purple; *Golden Hermine*, rich yellow. Amongst others of later introduction:—*Princess Louis of Hesse*, rosy pink; *Julie Lagravère*, dark velvety crimson, one of the very best and most effective; *Norma*, ivory-white; *Eve*, sulphur-yellow; *Little Harry*, Lord Clyde, *Bernard Palissy*, fiery orange; *White Globe*, *Lord Derby*, *Princess Teck*, and *Guernsey Nugget*. In the small-flowered section the three forms of *Cedo Nulli*, blush-white, lilac, and yellow, are not easily surpassed for the profusion of flowers they produce; *Marabout*, white, a most effective flower; *Mrs. Dix*, *Mr. Astey*, *Aurora Borealis*, *Salomon*, *White Trevenna*, *Rose Trevenna*, *Lizzie Holmes*, *Jason*, *Florence*, *Fabiola*, and *Danäa*. The above may be relied upon as amongst the very best for conservatory decoration and the production of cut flowers for general purposes. *T. Baines.*

FRUIT HOUSES.

STRAWBERRIES IN POTS.—A prolonged continuation of temperate weather has been the means of greatly accelerating the growth in these plants, and notwithstanding the backwardness of the layers this season the plants should at the present time be in an excellent condition for the purpose required; and, if not already done, they should now be placed where they are to remain until required for forcing operations, since very adverse conditions externally may at any time be expected. If it be absolutely necessary to have ripe Strawberries at the earliest period possible, start a good batch of plants at once and make ample provision for the defective ones, as these will be sure to abound amongst the lot; but if they are not required to be ripe before the end of next March, another fortnight's rest may with benefit be accorded the plant. **Vineries**, peacheries, or similar houses, when the trees are very gradually stimulated, will afford suitable conditions for starting these plants. But there is much risk arising from the fact that that terrible enemy the red-spider will be introduced into the houses with them; and therefore as far as practicable we avoid the use of these means, and select for the purpose pits which are adapted to the requirements, and in these employ fermenting beds, which are brought up in close proximity to the glass; on these beds the plants are stood, and obtain valuable assistance at this early period from the gentle heat which is present at the base of the pots. Avoid premature excitement by means of supplying an abundance of air whenever necessary. A temperature of about 50° at night, and 60°, with a slight admission of air, in the daytime, will be suitable. The best sorts for starting now may be selected from *Black Prince*, *Keens' Seedling*, *Vicomtesse Héricart de Thury* (which is identical with *Garibaldi*), or *La Grosse Sucre*. *Geo. Thos. Miles, Wycombe Abbey.*

VINES.—Where the latest houses were allowed to struggle through the past cold unfavourable spring without the assistance of steady fire-heat—many people labouring under the mistaken idea that late Grapes cannot be too late—the chances are in favour of imperfectly ripened wood still carrying foliage and half-coloured fruit, which no autumn firing can bring to perfection. In cases of this kind, although matters may look fairly promising for a time, the berries will be sure to shrivel immediately after the fall of the leaves, and the attempt to keep the Grapes till May will end in disappointment. To make the best of this position, steady firing with liberal ventilation on all favourable days must be followed up, but the house must be kept cool at night, with a little air at the apex to allow of the escape of moisture. If not already attended to, no time should be lost in the removal of extra growths, laterals and foliage, as it parts freely from the Vines, but the wood of the past year should not be shortened back too near the bunches if they are to be removed to the Grape-room. Vines in pots and inside borders which were started early in November under the influence of fermenting leaves and horse-dung will now be breaking, although very little fire-heat, owing to the mildness of the season, has been applied. Let the rods be syringed with tepid water twice a day. Give a little air when fine to sweeten the atmosphere, and slightly raise the temperature when the weather is bright, but a low night heat must be maintained until after the turn of the season—53° at night with a rise of 10° or 12° by day will be

quite sufficient for the present. If it is intended to apply fermenting materials to the outside borders of these early houses a good body of warm Oak leaves should now be laid on and covered with wooden shutters, which should be supported above the top of the leaves with a sharp slope to the front for throwing off water. Get succession houses ready for starting, follow up pruning, cleaning, and painting, and keep the work well in hand. Cut down young Vines intended for growing into fruiting canes, and keep them in a dry cool house, also select and preserve thoroughly ripened prunings for eyes and grafts. The latter upon the bottle-system may now be put on with every chance of success. *W. Coleman.*

KITCHEN GARDEN.

Luxuries in this department are always highly appreciated, and a standing one is New Potatoes. Where there are proper conveniences for growing them now is a good time to select sound tubers, and place them on sand in any structure where there is a gentle heat secure from frost. The object is to get them to start, and when they have sprouted 1 inch they will be ready for potting, which is the easiest way to secure this the very earliest crop. As a rule I do not consider it necessary to use large pots; I have known a single tuber to fill a 5-inch pot with young tubers of a fair size, but an 8-inch pot with four good-sized tubers, will better recommend itself for general purposes to the cultivator. I think the reason why pot culture in the early forcing of this vegetable is to be recommended is on account of the limited amount of soil at the disposal of the roots, which predisposes them to a limited growth of haulm, and a consequent diversion of nourishment to the tubers. I have found the Coldstream when true an excellent sort for the purpose; for frame work I prefer Veitch's Improved Ashleaf and the old Early Frame if it can be procured true, which is rather doubtful; failing that I should adhere to the Coldstream as a very excellent early frame Potato. The space in frames being so limited it becomes an object to secure the germination of each tuber before being planted, for amongst the modern high-bred early sorts we often find many which never sprout at all, owing probably to their extreme smoothness of outline, which is one of the first characteristics of highly bred Potatoes, but which renders them liable by friction in moving about to be entirely denuded of their embryo buds. Such tubers will remain sound in the ground for many months, but will never make a start into growth. In order to obviate this, where there is much early work required, it is always best to begin in time to spread them out singly on sand on the floor, under stages in greenhouses, or in any other such-like place where they can have a temperature secure from frost, but by no means a high temperature: spread plenty out, and the chances are that a good proportion of the lot will begin to sprout some considerable time before the remainder, and thus a succession will be maintained and a certain growth of those planted secured.

Again, with reference to luxuries, the forcing of *Asparagus* will now form an important item of work. At this dormant and dull time of the year there is always a difficulty (in forcing by means of fermented manure in frames) in maintaining an equal balance between the bottom and top-heat. It often happens that, in order to obtain a sufficiency of top-heat, the bottom-heat must be maintained at so high a degree as to destroy the vitality of the roots, and to ruin the crops, so that in the case of forcing by means of fermented dung it is better to wait awhile until the sun can be brought in as an auxiliary. In the meantime, if a supply at this season is indispensable, the aid of bottom-heat from hot-water pipes must be called in, and provision made to carry the heat through the bed by means of vertical pipes so as to supply top-heat, by which means that great necessity, top-ventilation, may be applied under the most favourable conditions, and thereby both colour and flavour be insured. The roots may be covered about 3 inches above the crowns, and the surface of the soil should not be much more than 4 inches from the glass.

French Beans will also require the aid of a sufficient command of heat, and there is no better erection for the purpose than a pit heated by hot-water pipes having a stage over them on which to stand the pots, that is, if pot culture is preferred, which possesses many advantages where a sufficiently moist atmosphere can be insured to keep down their greatest enemy, the red-spider. If required early, the first batch may be sown at once in 8-inch pots. Fill the pots two-thirds of their depth with light rich soil, and on this place six seeds, say of *Oshorn's* forcing, which is a good setter for early work; cover the seeds more than an inch, and place the pots in the pit. From the first, endeavour to avoid a close and stagnant atmosphere by frequent ventilation, and as soon as the rough leaves are well above the rims of the pots soil them up. Keep them as near the glass as possible, and never let them want for water at the roots and a moist atmosphere. The forcing of *Seakale* and *Rhubarb* must also have the necessary attention, as recommended last month. *John Cox, Redleaf.*

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 8, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Dec. 12	Sale of Bulbs and Plants at Stevens' Rooms.
THURSDAY, Dec. 13	
	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, Dec. 14	Sale of Liliun auratum (from Japan), at Stevens' Rooms.
	Sale of Nursery Stock and Lease of the Mansfield Road Nursery, Gospel Oak, by Frothero & Morris.
SATURDAY, Dec. 15	Sale of Roses, Shrubs, Dutch Bulbs, &c., at Stevens' Rooms.

IT is rather amusing to see what an outburst of virtuous indignation has arisen in the public journals since the publication of the SEED-ADULTERATION CASE at the Mansion House on November 26, when judgment was obtained against a noted seed-doctor. A report in the Police Court attracts public attention much more forcibly than any number of Blue-books, or of denunciatory articles in class journals. At the time when the seedsmen were engaged in promoting the passing of the Act, we stood almost alone among our contemporaries in pointing out the nature and extent of the evil, and in urging the necessity of legislation. The daily press either would not or did not take up the matter. What were the interests of farmers and gardeners to them? But once the case comes into the Police Court, and a wail is uttered loud and far-reaching, correspondents inundate the Editors with suggestions half of which betray only the ignorance of the writers, and the remainder are for the most part either inapplicable or already well known and acted on by the prudent ones. All this, however, is a matter of little consequence in comparison with the fact that public attention has been called to the matter, and that in consequence it will be increasingly difficult for seed-doctors to carry on their nefarious practices, and for purchasers to maintain so iniquitous a system. The *Times*, in its newly-excited wrath, has made the discovery that seed adulteration is the latest novelty, or, as immediately qualified, "so far as the disclosure is concerned." It is pretty obvious from this what degree of information on such matters may be expected in Printing House Square. Nevertheless, in the interests of the public we can but rejoice at the publicity which has been given to this case. One thing, however, we must protest against, and that is the indiscriminate aspersion of all dealers, honest and dishonest alike. Some firms indignantly deny that at any time they have had dealings of this questionable nature; others admit that at one time before the passing of the Act they dealt in seeds at prices which they knew—and the consumer might have known had he exercised a little common sense—could not be remunerative if pure or "nett seed" were sold. There was no particular secret in the matter. Dealers supplied nett seed to those that required it, and inferior seed at corresponding prices to those who sent orders for it. They were compelled by stress of competition to do what their neighbours did. By-and-by the thing came to a head. Honest men did not like to be mixed up in such transactions. A stand was made against them, and ultimately the Bill was passed by the exertions of the members of the seed-trade itself. Comparatively lately the "improvers" began to show signs of increasing business, and means were taken, again by the seedsmen, to check their procedures. So well has the Act worked, that it became necessary, as the report showed, for the greatest caution and secrecy to be employed in carrying on the business, and of course proportionately so in detecting and exposing it. This being the case, it is a libel upon respectable firms to say, as the

Times did on Tuesday last, "that any seed merchant may go to Mark Lane, the great market for seeds of every kind, and obtain at very moderate prices any quantity of seeds that have lost their vitality by age, by being boiled, or kiln-dried." The writer of the article in question evidently did not read a full report of the trial, or the account there given of the difficulty of transacting business of the kind alluded to.

There is soul of good in things evil, and the dilution of good seed by "dead seed" has the advantage which seed sowers, whether they be gardeners or farmers, are so slow to act on of securing "thin seeding." This is a matter of great importance in the case of Turnips, and may save much subsequent labour in hoeing. Even market-gardeners, the best cultivators, so far as their range extends, are too apt to fall into the wasteful extravagance of over thick-seeding. But admitting this possible advantage in diluting seed, JOHN BULL—poor gullible mortal that he is—does not like to be cheated, and is apt to wax wroth if he buys as coffee what is really coffee *plus* chicory, even though he may have no objection to chicory.

To revert, however, to the case before us. We have had the advantage of seeing the reports of the inspectors, some of which have already been made public, and others probably will be shortly, and they disclose an amount of killing, dyeing, and "improving" seeds of various natures that we were not prepared for. White Clover is dressed to resemble Alsike. Seed of inferior quality and low price is doctored and then sold at an advance of more than 100 per cent. Seed of one plant is made to resemble that of another of totally different kind, so different that the merest tyro in botany could tell the difference were the husk removed. Of course, this seed is killed so as to prevent its germination and the consequent detection of the fraud, and this sort of thing has been done, not by the ton, but by the hundreds of tons. Agricultural seeds naturally form the bulk of the patients that come under the hands of these "doctors," but garden seeds of various kinds are stated to undergo medical treatment of this kind. The seed is subjected to heat, exposed to the fumes of sulphur, for greater or less time, in a nearly air-tight dark chamber, the seeds being placed on fine haircloth stretched tightly a few feet above the fire, on which the pots containing the brimstone are placed. Various means are used to stain the old seed so as to give it a new and fresh appearance. Further details it would not be advisable to publish at present. We have said enough to show—what was by some people doubted—the necessity for the Act, and the desirability of protecting the honest dealer and the unwitting consumer. We cannot help, however, commenting on the way in which the latter class of the community have allowed themselves to be defrauded, because they would not take the very small modicum of trouble required to test the percentage of germinating seed in any sample that may be presented to them. If the placing a known number of seeds in a flower-pot and watching the numbers that germinate, or if the scattering a few seeds upon a piece of flannel kept moist, be too much trouble, then the consulting botanist of the Royal Agricultural Society might be applied to at an outlay of a few shillings, or arrangements might probably be made for the trial to take place at the gardens of the Royal Horticultural Society at Chiswick.

— THE customary removals and replacements on the COMMITTEES of the ROYAL HORTICULTURAL SOCIETY have, for the ensuing year, we are informed, been effected, and we cannot but regret that in a matter of such immense importance to the welfare and reputation of the Society and for the interests of horticul-

ture in particular the filling up of these vacancies should not be effected in a more open manner. For instance, would it not add to the intrinsic value of these committees if a third of the members retired by rotation every year and were not eligible for re-election next year? Thus some eight or ten fresh men could be added to the committees each season, while a good number would be kept in constant training. With a view further to secure the very best men, irrespective of personalities or dislikes, it might be arranged that the nomination of the new members should be left in the hands of the entire committee at their last yearly meeting, and if each of these were elected by show of hands there is little doubt the best men would be selected. The *prestige* of the South Kensington committees is so great, and is of such immense value to the Society, that everything that is possible to be done should be done to maintain that *prestige* and uphold their popularity. We would further suggest that when persons of known ability in their respective branches of horticulture are present at the meetings, they should occasionally be paid the compliment of being invited to take a seat at one or other of the committee tables. This step would tend largely to promote confidence in the decisions of the committees, which are at all times looked for with great interest, although not all times with an equal amount of satisfaction. As the market value of plants may be increased or otherwise by the decisions of these committees, it is of the highest importance that they should be made by the very best men.

— THE cultivation and production of COCHINEAL IN THE ISLAND OF TENERIFFE has of late years been so abundant that the market has become quite glutted, the supply, in fact, exceeding the demand to such an extent that its cultivation ceased to be remunerative. The latest report on this culture, however, shows that cochineal has again become a profitable production, the marked decrease in stock and in shipments which previously prevailed enhanced the value, and consequently increased speculation in all the European and American markets. This sudden return to prosperity may, however, be disadvantageous if the planters, who will not be convinced that it may end as suddenly as it commenced, should increase the production to the extent it reached a few years ago, when the quantity sent to market exceeded by far the power of consumption.

— THE ordinary monthly meeting of the SCOTISH HORTICULTURAL ASSOCIATION was held at 5, St. Andrew's Square, Edinburgh, on the evening of the 4th inst. There was a large attendance of members, and the President, Mr. DUNN, Dalkeith Palace Gardens, occupied the chair. Fifteen new members were admitted, and seven others were proposed and seconded for admission as members at the next meeting. The subject treated was the "Kitchen Garden," by Mr. LAWRENCE DOW, Saughton Hall Gardens. At the outset he urged upon young gardeners the necessity of devoting great attention to the proper management of the kitchen garden, so as to keep up a constant supply of first-class vegetables; some were very apt to look over this department in their anxiety to have a fine display of bedding and greenhouse plants. He then in a practical and lucid manner described the different methods of treatment by which he had been most successful in growing Potatoes, Onions, Jerusalem Artichokes, Parsley, and Asparagus. Several members expressed concurrence with Mr. DOW's views as to the importance of the subject, and also as to the modes of culture pursued. Mr. DOW received the thanks of the meeting for his paper, and at their request agreed to continue the subject at a future time. A communication from Mr. JAS. MORRISON, Preston Hall Gardens, was read, advocating the autumn planting of the Potato, and also attaching great importance to the proper ripening of the seed tubers. A vote of thanks was passed to Mr. MORRISON for his excellent contribution. It was then intimated that the subject for discussion at the next meeting was the "Phlox and Pentstemon," to be opened by Mr. JAMES GRIEVE, Pilrig Park Nursery.

— An excellent confirmation of the remarks made in these pages last week respecting the PRODUCTIVENESS OF THE HOLLY is now to be seen in the Feltham Nursery of Messrs. C. LEE & SON, where a large quantity of bush and pyramidal Hollies of

many kinds are grown. The confirmation is, however, chiefly drawn from the green-leaved kinds, of which some pyramids of various stages of height are literally covered with masses of rich scarlet berries, and present in that condition the most pleasing and reasonable subjects for entrance hall, corridor, staircase, or general decoration, that it is possible to conceive. Nearly all of these plants are of a convenient size for lifting into pots and small tubs, and so treated would keep their berries bright and foliage fresh for several months. Branches, however decorative, wither in a couple of weeks, but these trees would be beautiful all the winter. It is most

singularly beautiful, fine trees, from 30 to 40 feet in height, being covered with fruit.

— A grower of young GOOSEBERRY BUSHES recently stated that he had an order to supply 30,000 bushes of these to a large market-gardener in the western suburbs. This may be an exceptional order, but it is a fact that the Gooseberry is planted in immense quantity every year, and as these, if well looked after, will remain productive for twenty years, or even longer, it may be accepted as a rough but possibly not incorrect estimate, that if 100,000 young bushes be planted in the Metropolitan district every

of railways has induced many thus sent adrift to get further into the country, where both land and labour are cheaper. Manure agents have so largely the command of the manure market, that an agreement with one of these will ensure the delivery at a station any number of miles from town of hundreds of tons of manure during the season, at a price scarcely higher than a similar quantity can be carted home by those local men who have their own vehicles. The same facilities avail to send the produce of the soil to market, and therefore our vegetable and fruit market district is no longer limited to the immediate locality, but is distributed in a wide provincial area.

FIG. 139.—CARLUDOVICA DRUDEI—MUCH REDUCED. (SLE P. 715)

noticeable that the trees which are bearing the greatest profusion of berries have produced the least young growth, in other words they have felt the check given by frequent lifting the most, and have therefore been the earliest driven into fruiting. Another curious illustration of that view of the production of Holly berries was recently noticed when riding through a portion of North Hants, near to Eversley. In an adjoining plantation a bush Holly about 8 feet in height was seen covered with berries literally, so that scarcely a portion of the wood was visible. From the main stem of this bush, and about 12 inches from the ground, a fine robust growth had started out, and this was now taller than the berried portion, but full of leafage, and with not a single berry. All through that locality the Holly is now

year, within that radius there is now being grown about 2,000,000 bushes—an enormous quantity, but probably far below the mark. One reason why such a large number must be planted each year is found in the continuous and advancing crowding-out of market and fruit gardens near to London. The land cannot be removed, but the occupiers can be, and these have to quit their former habitations, which with their gardens, soon disappear in the overwhelming wave of bricks and mortar which under the name of houses is fast converting all the near country into populous towns. With this obliteration of many old gardens comes the necessity for their resuscitation elsewhere, as each new obliteration brings with it a new and augmented crowd of consumers. The great conveniences to market-growers now offered by the multiplication

— Judging by the results seen in the growth of dwarf Vines and Strawberries in pots at Heckfield, the BUFFALO-HORN MANURE must possess most valuable manurial properties. The Strawberry plants, being limited in root-space, perhaps offer the most forcible illustration of its value, as these in small 24's are most exceptionally robust, the crowns large, and the foliage of a deep green hue. A moderate portion of the manure mixed with the soil proves to be a singularly valuable constituent.

— The Veitch Memorial Trustees, at a meeting held on the 4th inst., confirmed their provisional resolution to place a VEITCH MEMORIAL MEDAL with a prize of £5 at the disposal of each of the under-mentioned societies, for the several subjects specified,

It having been ascertained that the exhibitions in 1878 of the respective societies will take place at a period of the year when these subjects can be produced :—

MANCHESTER, June 7.—For the best specimen Orchid, in bloom.
 YORK, June 19.—For three bunches of Black Hamburg Grapes.
 CLAY CROSS, August 13.—For a dish of Peaches, and a dish of Nectarines.
 HEREFORD.—For twelve cut blooms of the best New Rose, sent out within the last five years.
 EXETER, August 23.—For a collection of twelve kinds of Vegetables, distinct.
 BRIGHTON, in June.—For one bridal and one ball-room Bouquet.
 WOODBRIDGE, July 11.—For three stove or greenhouse plants, in bloom, distinct.
 READING, May 23.—For three stove or greenhouse plants, in bloom, distinct.
 DUBLIN: ROYAL HORTICULTURAL OF IRELAND, in August.—For three bunches of Muscat of Alexandria Grapes.
 BELFAST.—For twelve cut blooms of the best New Rose, sent out within the last five years.

The prizes are to be open to competition amongst *bond fide* gentlemen's gardeners, eligible to compete at the several shows; and the subjects exhibited are in all cases required to display superior cultivation.

— Early in the new year we hope to present our readers with an ILLUSTRATED SHEET ALMANAC of entirely new design, and beautifully coloured by chromo-lithography.

— Mr. W. HUTCHISON, The Gardens, Llwynder Court, Abergavenny, states as a proof of the mildness of the season in that locality, that he gathered a dish of Peas on December 1. The variety was Omega. The Princess of Wales Strawberry is also in bloom, and bearing fruit. Large plants of Genista tinctoria, 5 feet through, are also now in bloom. They have been planted out four years. *Salvia fulgens* and patens are still flowering; and that fine shrub *Arbutus Unedo* is now in magnificent form. The fine foliage, with the waxy flowers and scarlet fruit, make up a combination seen in no other hardy shrubs. They grow in perfection at Llwynder.

— It is announced that the *Florist and Pomologist* will in future be enlarged to imperial octavo size for the purpose of giving a more perfected appearance to the coloured plates.

— Mr. G. R. DALEY, head gardener to the late Mrs. BIDE, Kingston House, Yeovil, Somerset, has been appointed head gardener to THOMAS TODD WATTON, Esq., Maperton House, Wincanton, Somerset.—Mr. JOHN BARNWELL, late gardener at Gamons, Hereford, has taken a long lease of the graperles at Worthing, where he intends to carry on the business so long held by the late Mr. BAKER.—Mr. ARCHIBALD SCOTT, late foreman under Mr. FOWLER, Casile Kennedy, has been appointed head gardener to the Right Hon. Lord ELPHINSTONE, Carberry Tower, near Edinburgh.—Mr. F. CORBOULD, late gardener to the Earl of LISBURN at Crosswood Park, Aberystwith, has been appointed gardener to the Earl of COTTENHAM, Tandridge Court, Godstone.—Mr. JOHN CLARK, late gardener to U. S. MITCHELL-INNES, Esq., Parson's Green, Edinburgh, has been appointed head gardener to the Earl of Rosslyn, Dysart House, Fife.—Mr. THOMAS KEETLEY, gardener for many years to the late ROBERT RUSSELL, Esq., Newton House, has been appointed gardener and manager to W. EVANS, Esq., Darley Abbey, Derby.

— Mr. CHARLES SHARPE, of Sleaford, requests us to publish the following extract from a letter of his which appeared in the *Times* of Thursday last :—

"In justice to the seed trade at large, will you permit me to say, as chairman of the Committee for the Promotion of the Seed Adulteration Bill, that it proceeded from the seedsmen; and, although we had a hard fight to get it passed, yet we received the warmest support generally from those engaged in the business, and there was scarcely a respectable house that did not contribute to the fund raised for the purpose of passing the Bill through Parliament, and recently in the course of the inquiries and investigations into the reports of adulteration which have been instituted by a committee of the

seed trade appointed for that purpose we found that although adulterated seeds were prepared, yet the preparation was confined to but a few of the most unprincipled and less scrupulous members of the trade, and the business generally was free from the suspicion of any breach of the law? There is sufficient courage and determination in the trade to continue the course indicated by the proceedings at the Mansion-house last week, and in the end to eradicate the firms engaged in these nefarious practices. But I am bound to speak from my large experience of the seed trade in this country of the intense anxiety displayed by seedsmen generally that the manufacture and sale of worthless seeds should be prohibited, and I have witnessed with pleasure the decided tone in which they express their wish to assist in rooting out anything of a dishonest character in connection with their business."

— The fine specimen of *EUONYMUS RADICANS VARIEGATUS LATIFOLIUS*, growing against Mr. PARKER'S house at Tooting, is bearing fruit this season for the first time. One or two other instances of the fruiting of this plant have been brought under our notice this season, but the occurrence is sufficiently rare to warrant it being recorded.

— The following statement with reference to the SEED ADULTERATION BILL, and the proceedings recently taken in connection with it, has been handed us for publication :—

"When the Bill was promoted a pledge was given that it should not remain inoperative, and as soon as the Bill was passed an organisation was attempted for the purpose of carrying out the provisions of the Act; but from want of sympathy, arising partly from the belief that the passing of the Act would be cordially accepted, and nothing further would be wanted to prevent adulteration, it fell through at that time. For two or three years the agitation caused by the passing of the Act was sufficient to prevent any breach of it; then there were complaints that one establishment in London was doing a large business in dyeing and colouring Clover seeds. A detective officer was engaged, and solicitors were employed; but the officer reported, that although he could see the seed going into these premises and going out again, and though he had been in company with the men employed, yet they were so well paid and so well drilled in their duties, that it was impossible to obtain sufficient information upon which to ground a prosecution.

"After considerable time and money had been spent, it was resolved that a communication should be addressed to the agricultural and horticultural papers, warning the public that adulterated seed was being prepared, and for the time it was thought this was sufficient.

"It may be observed that no further complaints were made until last season, when it was reported that a considerable quantity of seed was doctored, and again it began to be looked upon as a matter of course.

"From past experience, which showed how difficult it was to bring the facts of the case home to the offenders, it was thought necessary to obtain powers to search premises where *prima facie* evidence could be given that they were employed in the manufacture of adulterated seeds, and assistance was sought from the proper quarter; but from the lateness of the session, and the obstructions existing at that time, it was impossible to obtain it.

"In the beginning of July stronger representations were made, and it was considered desirable to make an investigation to discover the extent to which adulteration really was practised. This resulted in showing that several large establishments had been erected, new capital and several additional firms were engaged in this nefarious trade.

"The Inspectors in their second report thought that the strictest privacy was desirable; and when they had finished their investigation, and had completed their case against the offenders, their reports were laid before the Chemical and Botanical Committee of the Royal Agricultural Society with a view to their conducting the prosecutions—it being thought that a great public Society, representing such important interests, could better undertake the task than a few individuals whose efforts might be misunderstood, but whose object was only to maintain the benefits which the Act conferred upon honest trading, and to redeem the pledge given. Unfortunately, the Royal Agricultural Society was not able to move in the matter, although at the same time sympathising with its object. They could not accept so great a responsibility until the meeting of the Council in December. This left the course that was taken the only one open, as action must be commenced in a limited time from the date of offence being committed; and under these circumstances it was determined to pro-

ceed at once, and not lose the opportunity which months of labour had secured. It was not desirable to temporise further, as nothing but prosecution would be effectual.

"The benefits conferred by the Act, provided it be strictly enforced, cannot be overlooked; and in connection with this it may be mentioned that it is reported in one instance that 50 tons of Alsike were created last season by the aid of manipulation. When this transaction is borne in mind, and its importance estimated, the late disasters and surprises in the seed trade are not so unaccountable as they have seemed to be.

"What becomes of experience in inspection and calculation upon crops when the artist can step in and call into existence any quantity of seed for which he is offered payment, to say nothing of the degradation that such proceedings produce upon the standing and morality of the members of the trade?

"There are those behind who are more culpable than the actual manufacturers of these killed and dyed seeds, for if there were no purchasers there would be no temptation to break the law, and these ought to have accepted the Bill as carrying out the intentions of the Legislature. They may give trouble and annoyance, but in the end their defeat is certain to be complete; and they may rely upon it, there is enough courage and determination to continue the fight until adulteration is rooted out of the trade."

— The annual general meeting of the NATIONAL ROSE SOCIETY took place at the HORTICULTURAL CLUB, 3, Adelphi Terrace, on Thursday last, when there was a good attendance of members. J. JOWETT, Esq., Hereford, was in the chair, and among those present were Dr. HOGG, the Rev. C. H. BULMER, the Rev. H. H. DOMBRAIN, and Messrs. MORLEY, TURNER, CUTBUSH, W. PAUL, G. PAUL, MCINTOSH, CORP, MAYO, &c. A statement of accounts was laid before the meeting, but owing to the auditor not having certified to their accuracy through the absence of some vouchers, the formal passing of the balance-sheet was adjourned. The receipts were returned at £417 12s. 4d., among which the sum of £302 15s. 10d. figured as donations and subscriptions, and £67 16s. 6d. as the amount taken at the doors of St. James' Hall. On the credit side, the prize money paid amounted to £147 10s., advertising and bill-posting, £71 7s. 6d.; printing and stationery, £67 17s., while other items brought the expenditure to £417 8s. 2d. The Rev. J. B. M. CAMM sent in his resignation as one of the secretaries, which was accepted. The Rev. H. H. DOMBRAIN reported that the Crystal Palace Company had offered the committee the sum of £100, together with the services of their staff and exhibition appliances, if the show were taken to Sydenham—Saturday, June 29 in next year being the day named for the exhibition. Some objection was urged to the show taking place on a Saturday, on the ground of the inconvenience it would cause to the clergy and others coming from a distance; eventually the secretaries were instructed to write to the Crystal Palace Company to endeavour to get the date of the show fixed for Thursday, June 27, if possible. The subject of holding a show in the North of England was also considered, and at a recent meeting of the committee the Rev. Mr. DOMBRAIN was requested to write to the Secretary of the Royal Horticultural Society to inquire if the National Rose Society could hold an exhibition of Roses at Preston on the occasion of the great Provincial Show, the Royal Horticultural Society providing space, &c. To this application a reply was received to the effect that the Council informed the committee of the Rose Society that Roses are included in the schedule of the Provincial Show, and the Council trusted they would have the co-operation of the National Rose Society on the occasion of their show at Preston. It was then resolved that negotiations should be opened with the Council of the Manchester Botanical Society, with a view of holding a northern exhibition of Roses about the first week in July. In the event of this arrangement not being carried out, measures will be taken with a view to holding a show at Cheltenham about the same time. The Hon. and Rev. J. T. BOSCAWEN was elected Vice-President of the Society; and the names of Messrs. JOWETT, ATKINS, KEYNES, PRINCE, and CORP were added to the General Committee; the Rev. H. H. DOMBRAIN and Mr. MORLEY were elected Hon. Secretaries; and an Executive Committee was appointed to carry out the details of the exhibitions.

The Villa Garden.

MAKING A FRUIT GARDEN.—Last week we touched on "The Arrangement of the Fruit Garden," the "Soil for Fruit Trees," and "What to Plant;" and the article closed with a selection of the best sorts of Apples for pyramid and bush trees.

APPLES FOR STANDARDS.—In continuing the subject, "What to Plant," it may be remarked that there are some gardens where it might be desirable to plant standard trees as well as pyramid trees, or to plant standard trees wholly. The size of the garden and the general convenience has something to do with this, also the taste of the planter.

Here is a selection of eight dessert Apples well adapted for standard trees:—Yellow Ingestre, Kerry Pippin, Cox's Orange Pippin, Fearn's Pippin, King of the Pippins, Braddick's Nonpareil, Court of Wick, and Court Pendu-plat. This is an all-the-year-round selection, comprising early and late varieties, and thus, when there is sufficient quantity of the fruit, enabling the grower to have Apples till long after Christmas. A further selection of eight culinary Apples will be found in the following:—Blenheim Pippin, an Apple that is also esteemed by many as a dessert fruit; Wellington or Dumelow's Seedling, Lord Saffield, Stirling Castle, Cellini, and Mère de Ménage.

The standard fruit tree has scarcely been fairly dealt with by writers. Gardeners have been subjected to a kind of hectoring in the matter, and page after page has been written to demonstrate the superiority possessed by pyramid trees over standard trees as fruit producers. There has been a great deal of begging the question in favour of the pyramid tree, and on the principle that "time tries all" we may here advert to the fact, that persons carried away by this new wind of horticultural doctrine a few years ago, and who planted their gardens with pyramid trees, are now sighing for a standard tree or two to relieve the monotony of the appearance, and perchance give them a little fruit. The tendency of much of this teaching has been to make the culture of fruit subordinate to the formation of a "toy" garden, where the natural outcome of vegetable growth should be subjected to pinching and pruning, and checking in various ways, to maintain a uniformity of shape and symmetry of appearance. The best answer to this is found in the fact that good standard Apple and Pear trees are always scarce, so great is the demand for them.

And we are a shade-loving people too, and that provided by a good standard tree, while it is most acceptable to man, is beneficial to the growth of vegetation below it. A garden without something to impart shade is bereft of one of the prime features of an English landscape, and this necessary protection against the sun can in the case of a small garden be had by means of fruit trees as well as by any other tree. We simply plead for that liberty to plant according to the scope of the garden and the taste of the planter.

SELECTION OF PEARS FOR THE VILLA GARDEN.

—The pyramid is certainly a favourite form of tree for the Villa fruit garden. Any one desirous of getting some good sorts of Pears on pyramids will find them in the following list:—Doyenné du Comice, Marie Louise, Maréchal de la Cour, Josephine de Malines, Winter Nelis, Glou Morceau, and Beurré Diel. This must be taken as a choice selection for a small garden, for a larger garden the list can be extended, for it does not include all the sorts best adapted for the purpose, but a few yielding what a Villa gardener will be certain to appreciate—a succession for eating.

If he wishes for a few good sorts for standards, he will find them in Doyenné d'Ete, Williams' Bon Chrétien, Louise Bonne of Jersey, Beurré d'Aremberg, Beurré Bosc, and Beurré Superfin; and further, if he should desire to add to the selection of pyramids just given, he will get what he requires in the sorts just recommended as standards, as they are suitable for the pyramid as well as for the standard form.

And there is no reason why the Villa gardener should not combine the useful with the ornamental. There is no necessary sacrifice of use to ornament by the introduction of illustrations of the modes of training trees found in some gardens. There may be the spreading standard, the graceful pyramid, and the dwarf bush—and these of themselves admit of pleasant variation in form—but there are also other modes

FIG. 140.—PENDULOUS CORDON PEAR TREE.

FIG. 141.—VERTICAL CORDON PEAR TREE.

FIG. 142.—VERTICAL CORDON PEAR TREE.

of training in practice, which it would probably afford the Villa gardener much pleasure to imitate. We give two illustrations of how bush trees may be turned into upright or vertical cordons (figs. 141, 142): and a further illustration of how a low standard may be made to assume the form of a pendulous cordon (fig. 140). It may be said this is reverting to the idea of a "toy garden" which in the earlier part of this paper we have appeared to condemn. What has been protested against is that principle of uniformity in fruit tree training which would have trees of one pattern filling a garden, and the doctrine which frequently accompanies the enforcement of this principle, that the pyramid tree with the continuous pinching process is the only one fit for planting in small gardens. There are many places in a garden where a tree trained similarly to those now represented can be placed, that would scarcely admit of a pyramid or bush being planted, and this is a matter worthy the consideration of the Villa gardener.

We have termed these trees "cordons" though they are not actually so, for a true cordon is said to consist of a tree having "a single branch, bearing fruit on spurs only, and never allowed to ramify." But it is not worth creating discussion over a term: the illustrations of training to which we have called attention will be readily comprehended by our readers.

Home Correspondence.

Wild Rice.—In consequence of several notices in your paper about wild Rice I got some over from a friend in Canada. He sent the seeds in a letter, but I am sorry to say not one seed germinated that I was able to discover. Some I sowed in an Orchid-house in a pan of water, and some I rolled up in some mud and threw into a pond, the rolling up in mud being to sink the seed and not let it get carried off at the outlet. I have asked my friend to try if he can get me some put into a bottle, then filled up with water and corked down, in which way I hope I may be able to get some to grow; also, if possible, to get me some of the roots, but if it be an annual that will be of no use. I also asked him to get me some Osage Orange seed, commonly called Bois d'Arc, and pronounced Budork or Burdock. Can any one say whether it will grow in this country? If so it would make a most excellent hedge, far before Thorn. I brought some over once and raised it in heat, but it did not succeed out-of-doors, at least all I had died. *F. R. Haig.* [Many unsuccessful attempts have been made to get the imported seeds of the Canada Rice to germinate. It has been in cultivation, but is difficult to keep. Eds.]

Planting Potatos in November.—About this time last year a number of letters appeared in the *Gardeners' Chronicle*, advising the planting of Potatos in November as a preventive of disease. I thought I would try this, and told the gardener to plant a few rows. He put in some Early Ashleaf and Walker's Early where we were to have Potatos planted in the spring. When the young Potatos showed I noticed that the spring-planted ones beat the others hollow in size and appearance of the shaws, but I said, Wait till digging time, whenever the gardener made any injurious comparisons as to the winter-planted ones. Growing time passed, and digging time came, and I asked the gardener how the special lot had turned out, and the report was, that bad as the spring-planted Potatos turned out the winter ones were still worse; the Walker's Early were both "small Potatos and few in a hill," and badly diseased and the Early Ashleaf were still worse, being very badly diseased indeed, few in number, small in size, and what little ones you did get almost useless.—*F. R. Haig, Blairhill, Stirling.*

The New Very Early American Peaches.—After a considerable experience in American Peaches, having grown nearly all known in Europe of these, the result has been to prove that their habit is unsuited to our English climate with but few exceptions. Like the American Potatos they degenerate after some seasons here, even under glass, and when grown with skill. There are, of course, some good kinds pretty well known now, and of these I hear the best reports of "Hale's Early," a favourite in its native climate, and I am thinking of trying it on the open wall. But by far the most remarkable at present are the new Peaches, the "Alexander" and the "Amsden June." Of these much is hoped, and I have them potted under glass, and hope to make a good report on them. I had them from Sawbridgeworth, and they look very promising healthy wood, plump buds, not too strong growers, just what orchard-houses require. My good old departed friend, whose loss I feel much, used to jest at my fondness for the "Yankee Peaches," especially the yellow ones, but always predicted that his seedlings would surpass them, and so they have.

Therefore we look with curiosity to see what the newcomers will perform. If they succeed they will give me Peaches in May without artificial heat, and may themselves become valuable for cross-fertilisation with Early Louise say, for that I consider the best early Peach as yet. But for the cracking at the stone Early Rivers is, however, earlier and sweeter—a grand Peach every way but this. *Thomas Brethau.*

Sericographis Ghiesbreghtiana.—This good old plant is not so much grown as it deserves to be. In the rage of late years for fine-foliage plants some of the good old blooming plants seem to have been lost sight of in many places, and this plant is one of them, as it is in only just a place here and there that one sees it, and then often in such a miserable condition that one cannot judge of its value. When grown well every one must admit it to be a useful and attractive plant at this season of the year, and all those who have to keep up a supply of plants and cut flowers for conservatory embellishment will find this a useful plant, as its smooth shining leaves and trusses of scarlet bloom make it very telling mixed with other plants. It is a subject of easy growth, as good plants may be grown from cuttings struck and grown on through the summer; by treating it liberally as to soil, &c., giving it a comfortable place in a stove or warm pit, and keeping it clean, as scale is its worst enemy, the grower will be repaid through November and December by some nice useful plants. *J. C. F. H.*

Thompson's "Gardener's Assistant."—In his otherwise very flattering notice of the new edition of the *Gardener's Assistant* in your issue of December 1 your critic objects to the price of the book as being too high for the pockets of many of those for whom it is mainly intended. Perhaps you will allow us to mention that the book is published in parts, as well as in the volume form, and will be completed in thirteen monthly parts at 2s. 6d. each. This brings the work within the reach of all, as the price may be spread over a considerable period instead of being paid at once. We may say that the work is very largely taken advantage of in this form by working gardeners, who, indeed, are our chief customers for the book. *Blackie & Son.*

Pinus insignis at Powerscourt.—A plant of *Pinus insignis* planted here in 1860, being then about 3 to 4 feet high, was blown down last month after having made the following remarkable growths in seventeen years from the time it was planted. It had attained the height of 41 feet, and measured 3 feet 2 inches in circumference of stem at 1 foot from the ground. Some of the annual growths were 3 feet 5 inches, and 3 feet 6 inches in length, and one was 3 feet 7 inches. Out of the great quantity of Conifers planted here *Pinus insignis* stands out pre-eminent, with its bright rich green foliage, which renders it easily distinguishable at a distance. Though it has proved to be not quite hardy in some parts of England, it is more hardy than many people are aware of. I have seen it withstand the frost when the thermometer had been within a few degrees of zero. This tree is remarkable for the great weight of foliage which it carries, hence the necessity of planting it in a good deep soil to bring out its massive foliage in perfection. If planted in dry gravelly soil the tree assumes a rusty appearance, and it will soon be perceived that it requires more nourishment. In most cases *Pinus insignis* withstands the wind admirably and makes free growths, and is well adapted for planting in proximity with the *Cedrus Deodara*, *C. Penford*, *Powerscourt Gardens*, *Co. Wicklow*.

Coloured Leaves.—May I be allowed to add to Miss Hope's charming list of coloured leaves the *Pulmonaria sibirica* (now so effective), and *Aram italicum pictum* for massive forms in her bouquet of foliage? The *Rhus glabra laciniata* can well afford to stand alone (though now it is leafless), and the happy possessor of a *Grevillea Hillii* tree can never be at a loss for exquisite foliage, lined with silver, to stand out against the deep crimson drapery of a winter evening. *H. M. E.*

The Eclipse Cauliflower.—It is not often I praise a new flower or vegetable, having been so often disappointed when I have grown and proved them to be far from what was expected, but I should like to say a word in favour of *Dickson Brown & Tait's Eclipse Cauliflower*. I bought a packet of seed last spring, and having grown it, do not hesitate to recommend it to every gardener in the kingdom as being in every way first-rate, and coming in at a time when other things are getting scarce, viz., in November and December. I have had a large square planted of the above, and a finer lot of Cauliflowers I would not desire to see, and they have been the admiration of all that have seen them. This is a vegetable second to none in my estimation (and my experience dates back for above thirty years), and it

ought to be as well known as the All the Year Round Lettuce sent out by the same firm some years ago. *J. Eastwood, Didsbury.*

Rivina humilis.—Allow me to draw attention to one of the most charming of old plants, viz., *Rivina humilis*, which at this dull and dreary season of the year when flowers are scarce enlivens our stoves with its coral-looking racemes of ripe and ripening fruit. A dozen or two plants well grown will repay any one for the trouble bestowed upon them. Their culture is most simple and easy, for they grow readily either from seeds or cuttings, requiring a rich light soil, good drainage, and a moderate amount of water, with a temperature of from 50° to 60° in winter. In the West Indies, from whence it was introduced in 1699, it is called the Rouge plant, its berries being used as a cosmetic. *G. J. Warren, Balcombe Place.*

Christmas Roses.—A very good way of dealing with Christmas Roses is to have two batches of plants when they are for pot work, lifting each lot alternately. By doing them in this way the plants are always in good condition and can be depended upon. I know a place where this practice is followed successfully. It is only natural that after plants have been lifted one year and potted they should be allowed a season's rest for growth, preparing them for being flowered in pots for indoor decoration again. Where flowers for church decoration are in demand these plants at Christmas are especially valuable, and it is one of the hardy plants that will never go out of fashion altogether. Still for high class and beauty of form it cannot be compared to the *Camellia*; but the associations connected with the Christmas Rose no doubt have a good deal to do with the interest in its cultivation. The plants referred to are planted in beds at the base of a wall having a western aspect. The beds will have two or three rows each in them with alleys between, the soil being of a good prepared loam, and in summer a layer of short Mushroom dung is spread over the surface of the soil amongst the plants. *R. M.*

Veitch's Autumn Giant Cauliflower.—I am glad to see in the different gardening periodicals such good reports of this truly excellent autumn vegetable. For the last two or three seasons previous to this I had begun slightly to despair of it, thinking that it might have degenerated or that we might have got some spurious variety introduced in its stead, but this season it has more than redeemed its character here and has been simply grand. We have been using it regularly since about the middle of September, and as a proof of the enormous size it may be grown to we have frequently during the last few weeks cut them from 30 to 36 inches in circumference, and about a fortnight back we cut one quite 45 inches in circumference, not coarse and open, but close, compact, and in every way a perfect Cauliflower. This followed by such varieties of Broccolis as *Autumn Self Protecting*, the true variety of *Snow's Winter White*, and others, with one or two such varieties as *Lauder's Goshen*, *Carter's Eclipse*, &c., will bring us on into the month of June, and with over winter plants and early sowings of the old *Walcham Cauliflower* for early summer months will enable any one if required to furnish good Cauliflowers or Broccoli nearly, if not quite, all the year round. *W. Nichol, Drinkstone Park, Bury St. Edmunds.*

Aponogeton distachyon.—Your excellent drawing and description (p. 649) of this very fragrant and charming old aquatic plant seems to have drawn forth remarks from several correspondents, which it well merits. In addition to the places named where it may be found growing it may be interesting to some of your readers to know that it grows tolerably well planted out in shallow rivulets here in East Anglia, where I fancy we at times get such cutting cold east winds as are not known in such general counties as Somerset or Cornwall, but in our case it is very difficult to protect it from the ravages of ducks, wild fowl, snails, &c., all of which seem to be particularly fond of it. A running stream may be its favourite home, but I cannot help thinking on parterres ornamented with fountains, the basins of which frequently have to be furnished with aquatic plants, the *Aponogeton* would form a delightful object. I would not immerse the roots of the plants so deep under water as one of your correspondents suggests, but place the pots say 6 or 8 inches under the surface of the water, during the summer months at any rate. *W. Nichol, Drinkstone Park, Bury St. Edmunds.*

—The description and figure of this very interesting water plant, given in the *Gardeners' Chronicle*, p. 649, is a very faithful one. It is well worthy of being brought into more general cultivation, both for its beauty and fragrance. Its hardy habit and free-flowering qualities, lasting from midsummer to late in autumn, are a high recommendation in its favour. Two places are mentioned in the article above alluded to where it succeeds in the open air. It may be some inducement to others to extend its cultivation to know

that it is still in flower in the open air here. We have upwards of a dozen large stools of it growing in three separate fountains, which have lived for upwards of twenty years. The only difference that is made in winter is to lower the plants deeper into the water, or below where frost would reach. I have on several occasions seen the ice on the surface 6 or 8 inches thick, but the plants were always safe in spring. It seeds freely, and I have frequently seen dense tufts of young plants round the old ones. On two different occasions I took out a number of plants and threw them into a running stream with grassy banks on its margin, where I thought it would establish itself on the sides, but the place was grazed with sheep, and they disappeared after the first year. *J. Webster, Gordon Castle.*

The Leamington Broccoli.—Those who have not grown the Leamington Broccoli I would recommend to do so next season, for it really is a good hardy variety, the heads being large, white, and of delicate flavour; while the last and not least of its good qualities are that it is the connecting link between late Broccolis and early Cauliflowers. *G. J. Warren, Balcombe Place.*

Centropogon Lucyanus.—This being one of the most beautiful free blooming winter plants, and of such easy culture, should be grown by all having any demand for cut flowers through the winter season. Cuttings struck in spring and potted on into 6-inch pots make a very useful size, and do well in any cool house through the summer. They should be brought into the stove or intermediate-house early in October when in a few weeks they produce an excellent supply of flowers. A few sprays enclosed will prove its free blooming qualities. *C. H., Chalfont Park.*

Duke of Buccleuch and Golden Champion Grapes.—It is discouraging to young gardeners to see, time after time, men who are looked up to and considered good gardeners recording in the pages of the *Gardeners' Chronicle* their inability to grow satisfactorily the above Grapes. One great light coolly tells us "he has converted them into dust and ashes," and another shining light sincerely informs your readers that he only finds them worth growing in "his Curiosity Shop;" and lastly, we have Mr. McC. asking for enlightenment from those who have been more fortunate than himself. I happen to be one of those lucky individuals, and gladly comply with Mr. McC.'s desire. In the first place I never found either the Duke or Golden Champion do well in a hot, close, moist vinery; in such houses Golden Champion is usually spoiled with spot before it is coloured, and in this failing the Duke is but little better than his relative. But when grown and treated as Hamburgs require to be when it is imperative to have them at their greatest perfection, and this can only be attained (as all Grape growers know) when the Vines are allowed to start in spring of their own accord, then brought gently on in a cool brisk growing atmosphere and allowed to have a long season of growth. Treated in this way I believe the Duke can not only be grown well but can be kept in good condition till December, and the Golden Champion until January. In proof of what I state I send samples of both. You will see the Golden Champion is as fresh both in foot-stalk and berries as they were when first ripened three months ago. I find both sorts do better when budded or grafted on the Hamburg, but not at the bottom of the rod. We are all agreed as to the magnificence of both Grapes, but in the little matter of cultivating them I think we still want education. While writing about Grapes I would like to know if any one has found *Waltham Cross* to turn out what it was professed to be, namely, a desirable white companion to *Lady Downe's Seedling*. As such it was awarded a First-class Certificate at a September meeting of the Royal Horticultural Society, an award that I have not seen anything in it to justify. I send samples of it for comparison with three of not the best but coarsest and worst flavoured sorts we have, viz., *Calabrian Raisin*, *Syrian*, and *White Tokay*. To intending planters of late Grapes I think your opinion on this will be valuable. *J. McIndoe, Hutton Hall Gardens, Gushborough.* [The Duke and the Champion were both excellent in texture and flavour, the former just going off, the latter quite fresh and plump. The other sorts are, in their present stage, decidedly inferior to the above, the Tokay and Calabrian Raisin being in the freshest and best condition. Syrian and Waltham Cross were both going off. Eds.]

—I am not in the habit of replying to anonymous correspondents, but as this is a matter of considerable importance both from a horticultural and personal point of view, I should like to say a few words, in explanation, if not in vindication of my conduct in connection therewith. I saw the Grape in question for the first time at the International Fruit Show at Glasgow; the bunches shown were of moderate size, but compact and well formed; the berries were extremely large and well

finished; the flavour was good. The Duke there and then certainly arrested my attention, and induced me immediately afterwards to go to Clovenford and see it growing in quantity, and judge for myself. On my arrival at Clovenford, Mr. Thomson kindly showed me a large number of bearing rods of the Duke in fine health, in every respect as vigorous and healthy as the other Vines in the same house were. The fruit had been cut and sent to market off a number of the Vines, but a full crop was still hanging on a few others; both the bunches and berries were equal in size—indeed, nearly all fit for an exhibition table. I soon after forwarded a short communication to the Editors of the *Gardeners' Chronicle*, describing my impressions of these Grapes, the Vines, and their fruit as I saw them, which in due course was published. I thought I was doing the horticultural world a service by assisting to bring under their notice a new and promising fruit; but, forsooth, at the end of "five or six years" I am to be admonished for so doing by "J. McC.," and cautioned to be more careful in future. I decline both the admonition and the caution, as uncalled for and impertinent. When a new fruit first makes its appearance surely we are justified in describing it as it appears to us, its character we cannot be held responsible for, because it is to make; when we find it in perfect health and fruiting abundantly, as I did in the case of the Duke of Buccleuch at Clovenford, I was surely justified in saying so. Every one who has had much to do with fruit culture must have observed how much varieties are influenced by soil, subsoil, and climate, and how much all depends on judicious treatment; the Vine is certainly no exception, and it may be that the Duke is more susceptible in this respect than most other varieties of the Vine. We have not yet had sufficient experience to speak with certainty on the subject. It is well known that considerable difference of opinion exists amongst Grape growers as to the possibility of generally growing this Grape successfully; almost none as to its merits when well grown. To all I would say persevere, give it a fair trial. I cannot forget the history of other Grapes, particularly the Muscat Hamburg, when it was sent out as a new Grape, now nearly twenty years ago; there was then a great run on it, almost every one who had a viney planted it, in most cases amongst old-established Vines. The borders being either partially or wholly exhausted, often imperfectly drained, as might be expected under such treatment a cry was soon raised against it, "it would not set," "it shanked," &c., and in not a few places it was rooted out and discarded as unworthy of cultivation, all admitting that when well grown it was a superb Grape. Here and there it was found to do well, particularly where it had been planted in a new well-drained border, formed of turfy loam and rough bones, and so long as the border keeps porous and does not get sodden we hear little of its tendency to shank, even when grown on its own roots, which after large experience I prefer to do. May similar causes not have something to do with the numerous failures in cultivating his Grace, which "J. McC." and others complain of. Some time after the Duke was sent out I had two plants of it planted in an old viney with the intention of inarching, but before they were in a fruit-bearing state I had to root out the old Vines, renew the border, and replant. I then planted a number of young Vines of the Duke, which this season produced a few small bunches, which set and finished well. I shall be glad in due course to report as to their future success or failure. *Archibald Fowler, Castle Kennedy, Stranraer.*

Odontoglossum Andersonianum.—Mr. Sergeant Cox's sample of the above species is certainly a most remarkable one. It must be a very fine branched raceme that produces forty-six flowers. The original plant which produced the first flowers seen in this country was a short-racemed species bearing eight flowers, and these flowers beautiful, though they have been eclipsed by at least two examples I have known—the one at the Messrs. Veitch's, Chelsea; the other at Mr. Wilson's, Westbrook, Sheffield. The latter is much the richest-flowered variety probably yet flowered in this country, having much broader segments with richer spotting in a comparatively clean white ground colour. Now both these varieties by no means throw large racemose spikes, and it is just possible that Mr. Cox's plant may be glorious! When I submitted the flowers to Professor Reichenbach at the time, he did me the honour to dedicate so rare and beautiful a plant. I and he were both clearly of opinion that there was a fusion of both habit and efflorescence of *O. Alexandræ*, or rather crispum and gloriosum, in the then novelty; and although the species have been generally found widely apart, still, anomalous as it may seem, the appearance of *O. Andersonianum* both in and out of flower is such as to justify us setting it down to being a "wild" hybrid. It is one of the few species even to the best practised eye that cannot be declared until its efflorescence is expanded (and no collector seems to know any special locality for it), but undoubtedly

a first-rate form of it is worthy of the front rank among the many beautiful gems now cultivated in the cool Orchard-house. *James Anderson, Meadowbank Nurseries, Uddingston, N.B.*

Strawberries Vicomtesse Héricart de Thury and Garibaldi.—In these days the rage for novelties is so great, and there has been such a lot of so-called new plants and fruits sent out of late years that it has become quite difficult to make a selection from any list, and more so seeing when one has got many of the so-called new things and grown them they prove to be so much like the old sorts, or no improvement, that they are not wanted or not worth growing. I think this applies to Strawberries to some extent. Having grown the first-named kind, I can speak of it as a good useful heavy cropping early sort, and as I was at the Fruit and Floral Committee meeting at South Kensington on October 2, when a dish of both sorts was exhibited, this gave me an opportunity of seeing them both together, and both myself and two or three other practical men could see no perceptible difference in them. I thought of trying them both together, but before doing so I should be glad to hear the opinion of some cultivators who have grown them both. *H. G. C. F.* [Garibaldi is now regarded as being synonymous with the first-named. Eds.]

Pronunciation of Plant Names.—It is hardly necessary to add anything to Mr. Harpur-Crewe's remarks as to the pronunciation of *Gladiolus*, but I may be perhaps permitted a word on some other propositions in Mr. Grindon's second paper. Surely it is as easy and as correct to sound the *p* in psamma, psidium, and psoralea, as in psychology—a word that presents no difficulties to persons of ordinary education. The initial *x* of *xanthorrhæa* is a greater stumbling-block to English tongues, but it is not desirable to make any special effort to reduce it to the totally distinct *z*. *Vishia*, *Blazhia*, and *Sparshium*, are sufficiently offensive in themselves, and I have no doubt are distinctly vulgarisms, and how would Mr. Grindon have us pronounce "petiole"? Finally, to pass to the kindred subject of orthography, what is the authority for "diphthong"? *R. A. Pryor, Baldock, Herts.* [Diphthong is certainly a printer's error, and should read diphthong. Eds.]

Wood Copings to Walls.—Your correspondent, "J. S.," p. 627, has stated so fully and accurately the action of radiated heat in connection with copings that little more need be said on that point. But with reference to our wood copings in use here it may with truth be said of them that it would be quite impossible to bring either Peaches, Apricots, Cherries, or Pears to any purpose without such overhead coverings, for under the copings the wood on the trees against the walls ripens earlier, and the fruit is also protected from the heavy rains which fall here occasionally. It appears to me that glass copings will prove equally fitted to serve the same purpose as wooden ones, with this additional advantage, that the glass will admit the light directly to the tops of the trees under the coping, whereas in the case of our wooden ones the light is excluded, leaving at the top of the wall a bare unsightly appearance. But copings of themselves, whether consisting of wood or glass, would not be sufficient to ward off such intense frost as we had last spring. Something thicker than netting is required; in fact, I found sail-cloth suspended from the coping not too much to protect our trees from the frost, cold winds, and sudden bursts of sunshine after frosty nights. Our Peach walls covered in with glass required the same kind of protection as that just noticed. So that if "orchard-houses are to continue familiar things" it is to be hoped that we will be familiarised with more genial springs than we have had of late. *John Cate, Inverary Gardens.*

Orchids at Rawcliffe Gardens, Glasgow.—These are looking very well just now, and a large number are in flower. *Calanthes* are grown in quantity, and flower from early in October until February. They are grown in 6-inch pots, with from five to eight spikes to the pot. One thing that is specially kept in view is the preservation of their foliage as long as possible, and this adds very much to their appearance. This is obtained by growing them steadily on without a check until their last flower is expanded, and their last leaf shed. By this method the number of flowers to the spike is far in excess of what is usually seen, such as from thirty to fifty on *vestita* varieties, and *Veitchi* is equally well flowered. Arranged as these are together with the other plants in flower at the cool end of the large Mexican house, the whole makes such a grand sight as would lead any one to think that winter is the season for Orchid flowers above all others, and in fact such is the case at Rawcliffe, where every effort is made, every art employed to produce as much flower as possible while the family are there to enjoy it. Here we find *Sophronites grandiflora*, a great favourite, several in flower, three of them with seven, nine, and eleven

flowers, each sufficient in themselves to light up a whole stage. *Cattleya exoniensis* proves itself to be one of the most useful autumn and winter flowers, being a good grower, flowers freely, and lasts long in beauty. A fine plant with three spikes and nine flowers has lasted in flower two months, and still looks as if it would last another month. What a pity it is that the true old *Cattleya labiata* is so scarce; it costs its weight in gold, and even then the propagator's hand most likely will have denuded it of most of its life's blood. One small piece is in bloom and excites a desire for more, but there is a limit to the importation of it. In *Oncidium varicosum Rogersii* the late importations have supplied a real want; *O. aurosum* we thought a lot of for winter bloom, until the former (a superior thing) unfolded and captivated us by its great beauty and usefulness. Amongst a number of plants in bloom there is one noteworthy spike which began to flower at the base in the end of June, and which afterwards rested for a while as if preparatory to making another great effort. It did start growing again, throwing out lateral branches as it grew, until now it is over 6 feet long, with eleven lateral branches nearly 2 feet long carrying two dozen flowers each. Amongst the *Cypripediums* in flower there is a large pan of bifolium with forty flowers, the greater number expanded, the others well advanced. This plant contrasts well with *insignis*, and is found to last much longer in bloom. Of *Odontoglossums*, of which there are a number in flower, the most noteworthy is *Rossii* giganteum, a perfect beauty, with six of its large flowers to the spike. *Angræcum sesquipedale* attracts great attention just now. It has two spikes and seven flowers, with a spur 16 inches long. Several *Vandas* are in flower and coming on, amongst them being *V. Cathcartii*. *Aerides Veitchii*, true, is flowering for the second time this season. Several plants of *Saccolabium giganteum* are in bloom, and amongst them one which is distinct from the ordinary type, having a much longer spike, and better in colour, besides flowering to the very point of the spike. Such are a few of the interesting subjects amongst Orchids that are in flower. The collection of plants at this place is well worth a visit, especially during winter and spring, while at all times there is much to see and interest one in such a large and varied collection. Just now the *Ouvirandra* is blooming freely, and in exceptionally good order, with the largest and best-grown leaves I have yet seen. *R. L.*

Cinerarias and the Frost.—I have had *Cinerarias* under my care most completely frozen, without any harm having been done to them, though of course every possible care was taken to thaw them slowly, and in the dark. Provided the plants were growing in a damp pit with means of heating if necessary at hand, I should not be afraid of trusting them to the tender mercies of a little frost, in fact our present stock passed through a few frosty days and nights last week with no more protection than that afforded by mats, however there were hot-water pipes to fall back on in case of emergency. Though I go very near the dangerous extreme myself with regard to keeping these plants cool, I would not advise others to do so under any circumstances where positive loss might accrue. *R. P. Brotherton.*

Viola Blue Bell.—It is quite certain that *Verhena venosa* deserves much more extended cultivation than it has hitherto had. It has other merits to recommend it beyond what "F. S." says, one in particular being that it can be raised in any quantities from seed, which requires to be sown early in a brisk heat, as the seed often takes a month to germinate. After this they only require the ordinary treatment of *Perilla nankinensis*, but although plants may be raised and planted out, and they flower very beautifully, it could not for a moment be compared with *Viola Blue Bell* either for colour, dwarfness, or for any merit that has been advocated for *Verhena venosa*. In October, 1876, we had a large breadth planted out on a light soil; the plants began flowering at Christmas, and continued in bloom until April, when it became one sheet of blue, in which state it remained all through the season. To test it thoroughly we had 500 or 600 plants taken up, divided, and planted out with the other ordinary bedding plants on a dry sloping bank, and although the weather continued moderately dry, the plants soon became one mass of flower, as was noted at p. 405 of the *Gardeners' Chronicle*; and hundreds that saw these two beds, and hearing of its treatment, could not be otherwise than unanimous in their opinion that no other plant could bear the slightest comparison with this as a blue bedding plant. *H. Cannell, Jun., Swanley.*

Do Roots Digest?—Your intelligent correspondent, "F.," is of opinion "that the roots of plants may elaborate, digest, or change the character of some of the food absorbed by them." It is impossible to contradict this theory, for there is undoubtedly

sympathetic nervous action going on in plants, but may we not look to the sun—the source of all light, heat, and force—the prime mover and promoter of all action? My idea is this—I may be wrong, I merely suggest it as a natural inference—*i. e.*, that the sun has the power to elaborate such a sap in the leaves of plants as may, on descending and exuding from the bark of the roots, have the property of acting on those ingredients in the soil which are only suited for the organisation of itself. This seems a more rational theory than that the bark of the roots should have instinct to select food only suited for the development of the plant to which they belonged; and may I also add more natural than that a root should have the power of digesting the food presented to it. In all probability digestion goes on in the earth, the exuded sap appears to dissolve the ingredients in the soil, and the roots appear to absorb them as soon as they are dissolved, thus connecting the circulation. As soon as the sap is out of the root it is reabsorbed, slightly charged with the material it had digested during the short period the sap remained in the outer world. *Observer.*

A New Mouse-Trap.—We set traps for the black beetle, *Blatta orientalis*, baited with bread crumbs. Very frequently lately these traps, when inspected in a morning, have been found quite empty. On Monday last there was an explanation of this. When one of the traps was shaken out as usual over scalding water a mouse fell out of it. It is strange that always before both the ingress and egress of a mouse had been practicable through the glass cone of the trap. On Monday night two mouse-traps were set near this beetle-trap, which was baited as usual. On the following morning the beetle-trap was quite empty, one mouse-trap had been robbed, and a mouse had been caught in the other. *S. M. O., Exeter.*

Desfontainea spinosa as a Hedge Plant.—Is your correspondent "G. Dodd" (p. 695) in earnest when he says, why not have hedges and banks of it instead of Privet? As it appears to be so hardy with him, let him set the example of planting a hedge at once, and report through your columns the annual growth of it, for say five years. I fancy the annual report would be looked for with great interest by your numerous readers. I have seen but one instance of its perfect hardiness, and that was in the County Cork, the annual growth being from 1 to 2 inches, which caused it to bear a stunted look. In England I have never seen a plant 2 feet high. *W. A., Ford Manor, Lingfield, Surrey.*

I have noticed at p. 694 "A. R.'s" inquiry respecting the hardiness of *Desfontainea spinosa*: I beg to inform him that there is a good specimen of this plant at Coed-Coch, Denbighshire, North Wales. The locality is a cold one, although the immediate position of the plant is well sheltered, being on the side of a walk well surrounded by *Rhododendrons*, and about $\frac{3}{4}$ miles from the sea shore, between *Rhyl* and *Llandudno*. *Observer.*

This shrub is quite hardy here, and flowers to perfection. The garden is so nearly the centre of the Vale of Clwyd, 3 miles from Denbigh, 100 feet above the sea. *Arthur Mesham, Pontyrrydyd, Trefnant, Rhyl.*

Aralia Sieboldii.—Having observed a notice of this ornamental shrub flowering in a cool greenhouse, I send you a specimen from the open ground at this place, which is literally covered with blossoms. In the lawn of my villa at Torquay I have a large specimen which gives me much satisfaction, but it is annoying to hear unlearned horticulturists exclaim, as several have done, "I see you have planted a new sort of Fig tree in your lawn!" *J. L., Combe Royal, Kingsbridge, South Devon.*

The Conservatory at Bestwood.—In the beautiful conservatory at Bestwood, Nottingham, the seat of his Grace the Duke of St. Alban's, are a couple of plants of *Musa Ensete*, which are fruiting and have a most noble appearance. They are grouped to produce a very fine effect, being surrounded with Palms, *Dracænas*, *Yuccas*, and Tree Ferns (these are all planted out). *Celosias*, *Primulas*, *Chrysanthemums*, *Coleus*, *Cyclamens*, *Salvias*, &c. are plunged in the bed, the whole producing as grand a spectacle as it is possible to wish for. There is also a splendid specimen of *Papyrus antiquorum*, with over sixty of its beautiful plumes, most of which are 12 feet high and 3 feet through the plume. As seen here this plant is an object of very great beauty for conservatory decoration. The roof is also adorned with *Passifloras*, *Tacodias*, &c., and trained on the back wall is a splendid specimen of *Lasiandra macrantha*, answering admirably to the description given of a fine example at another place. I may also mention that one of the most durable and elegant floors for conservatory work has been laid here; it is Roman mosaic work, and for neatness and beauty I have seen nothing to equal

it. Considering that this conservatory has only been built a little over two years, the grand effect produced reflects great credit on the skill and ability of Mr. Edmonds, the energetic gardener. *A. Outram.*

Veitch's Self-Protecting Broccoli and Autumn Giant Cauliflower.—Having grown the new Broccoli for the last two years with other sorts, I find that it is not so hardy, neither will it stand the wet so well as the Giant Autumn Cauliflower. I have now some of both in use, and the Cauliflower is looking as hardy and green as any of the late kinds of Broccoli, while the Broccoli itself is looking very sickly, many of the leaves having rotted off and left the young heads standing exposed to the weather. This may be owing to our ground being strong and wet (although other kinds do well), as it was the same last year. By making two or three plantings of the Cauliflowers I have had a supply up till Christmas. With the late planting being planted about 15 inches apart we get nice small heads, so that we use about three for a dish, such as I send you. The Cauliflower with us has been spoken of as being far the best when cooked, eating much softer and more tender altogether. *J. Lane, Pyrgo Park.*

Covering Early Vine Borders.—As "S. W. the Second" has asked what are the daily readings of the temperature of the outside borders where fermenting material is not used or the weekly means, allow me to reply that I have never taken the trouble to ascertain, but I have on two occasions tested the temperature of the border where fermenting material was used, and found that at 18 inches from the surface, and even at a much less depth, there was no perceptible difference as compared with a border simply covered with leaves. I do not think the question is of much importance. This experiment I made during the winters of 1861 and 1862, and I feel thoroughly convinced that, whatever amount of heating material be placed upon the border, it is impossible to drive the heat far down into it, and unless it can be driven down more than a foot or 18 inches, I cannot see that we are gaining anything by placing it there. Your correspondent's second question, as to what I consider "fermenting material to mean," is very easily disposed of. I consider the best heating material for such purposes as that under discussion to be leaves mixed with rather more than one-third stable manure. Most gardeners I think will admit that leaves used by themselves alone in anything like the quantity that would be amply sufficient for this purpose would not heat at all, or, if at all, only to such a limited extent as not to convey any heat to the Vine border. If "S. W. the Second" thinks that it is "something new" to grow early Grapes without the aid of fermenting material on the border, he must surely be very much mistaken, as early Grapes were grown in this way many years before ever the system of placing heating material on the borders came into use. My father, who for many years had the management of a nobleman's garden not many miles from here, was in the habit of sending to his employer's table Grapes in every month in the year, and he never in the whole course of his experience placed a single harrowful of heating material upon his borders; and I could mention many gardeners at the present time who have forced early Grapes for many years, and whose Vines are in excellent health without ever using it. More than that, I know many also who used to use it for years, but have discontinued to do so, stating as their reason that they do not believe it does any good and is simply a waste of material of a kind that they have none too much of. Unless your correspondents can prove that they can grow better Grapes, or as good Grapes, in a much less space of time with the hot-manure system than we can without it, I consider we have the best of the argument. A covering of a foot of leaves, with just a thin scattering of straw on the top, will exclude all frost from the border, and that is very nearly as much as can be said of fermenting material. *G.*

Reports of Societies.

Royal Horticultural: Dec. 5.—G. J. Clark, Esq., V.P., in the chair. The business transacted at the afternoon meeting was of the usual routine character, the awards of the Floral Committee being announced by its chairman of the day, and those of the Fruit Committee by Dr. Hogg, who made a few comments on the more interesting subjects exhibited.

SCIENTIFIC COMMITTEE.—Sir Joseph D. Hooker, Pres. R.S. in the chair.

Effects of Sandstorms on Wood.—The President exhibited samples obtained by himself in his recent tour in the Rocky Mountains of wood scored and furrowed by the action of the sandstorms, which produce a precisely similar effect to the sand-blast, now turned to practical use in the engraving of glass, &c. We shall allude more fully to this subject on a future occasion,

when, with Sir Joseph's permission, we shall be enabled to give an illustration of these curious effects.

Urocystis Viola.—Mr. Hemsley exhibited leaves of *Viola* swollen and deformed from the presence of a Fungus, *Urocystis Viola*.

Lapland Plants.—Rev. George Henslow exhibited a full-grown plant of *Betula nana* some 12 or 14 inches in height, with other specimens, from Lapland, brought over by the natives of that country at present at the Westminster Aquarium.

Double Flowers from Australia.—Dr. Masters exhibited double flowers of *Ranunculus lappaceus* and of *Eriostemon obovatus*, which he had received from Baron Ferd. von Mueller. Both were remarkable as illustrating the occurrence of double flowers in Australia, a circumstance at one time doubted by the late Dr. Seemann; but the occurrence of the double *Eparis* originally noted by Mr. Hemsley, and of other instances, show that the supposed infrequency of such flowers in a wild state in the southern hemisphere is due rather to imperfect observation than to any absolute deficiency. The *Eriostemon* above-named would from its beauty make a most desirable plant for introduction into our greenhouses.

Bulinus Goodallii.—Dr. Masters showed specimens of this pretty little snail received from a correspondent. It was originally introduced in some way from the West Indies to the nurseries of Messrs. Maule, of Bristol, and has subsequently been met with at various places, generally in Cucumber-pits.

Coccus flacciferus, &c.—Mr. Murray exhibited on the part of a correspondent a *Camellia* leaf affected with this insect, of which we subjoin a cut (fig. 143).

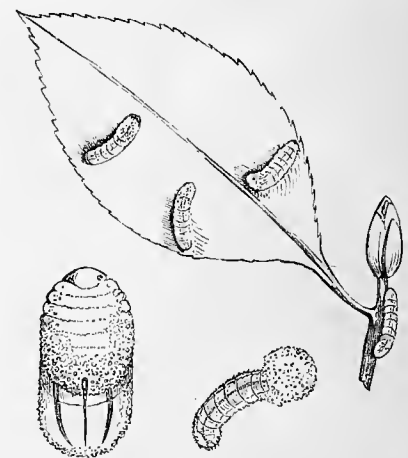

FIG. 143.—THE CAMELLIA COCCUS.

Peach Roots.—Specimens of the roots alluded to in our last issue, p. 688, were submitted to the meeting.

Agaricus geotropus or gilvus.—A beautiful specimen of this fungus was exhibited from Mr. Miles, gr. to Lord Carington, at Wycombe Abbey, in the grounds around which mansion it had been found. It is a handsome fungus of symmetrical form, whitish colour, and slight aromatic fragrance. It is reported to be edible.

Culture of Lilies.—Mr. G. F. Wilson related the results of his experience of the culture of Lilies in long deep pots, as explained at p. 659.

FLORAL COMMITTEE.—G. F. Wilson, F.R.S., in the chair. The concluding meeting of the year was by no means the least interesting of the series held since January last, the Council-room being well filled, and presenting a very cheerful appearance for a dull December day. First-class Certificates were awarded to Mr. William Bull for a distinct and handsome Tree Fern from the Sandwich Islands, *Cibotium pruriatum*; for the curious yet very elegant and highly coloured *Croton picturatus*, and for a distinct and bold habited South American Palm, *Geonoma princeps*. To Mr. Turner, Slough, for Tree Carnation *A. Alegatière*, the very fine novelty previously alluded to at p. 658. To Mr. Cannell, Swanley, Kent, for *Pelargonium White Vesuvius*, a veritable counterpart of the well known scarlet-flowered variety, from which indeed it is a sport. To Messrs. E. G. Henderson & Son, Pine-apple Place Nursery, Maida Vale, for *Chrysanthemum Golden Empress of India*, a fine golden sport from the well-known incurved white. To Messrs. Jackson & Son, Kingston, and Mr. J. W. Moorman, gr. to the Misses Christy, Combe Bank, Kingston, for *Chrysanthemum Fulton*, one of the Japanese section—of exquisite form and a beautiful yellow colour, an advance in this latter respect even on such a fine yellow as *Jardin des Plantes*. And to Mr. R. Dean, Ealing, for *Tropæolum Perfection*, a very useful, free winter

flowering variety of a rich scarlet-crimson colour. The award of a certificate to this flower was well-deserved, but it might have been given sooner. The plant has been many times shown during the last five or six years in much better condition than on this occasion, but always passed over on the ground that it was not sufficiently distinct from Mrs. Tredwell. However, it furnishes another admirable instance of patience and perseverance meeting with their due reward. Messrs. James Veitch & Sons again contributed an attractive group of Orchids, mainly consisting of Calanthes, Lælias, Cattleyas, Cyrtipediums, Lycastes, Masdevallias, and Odontoglossums, but including a very fine specimen of Cattleya exoniensis, with seven spikes and twenty-two richly-coloured flowers. The award of a medal to this specimen was recommended by the committee. In addition to the plants above-named, Mr. Bull exhibited a few handsome Cycads, a magnificent cordon of flowers of Lapageria rosea superba, with eighteen flowers on a growth about 18 inches long sent to him by J. P. Kitchen, Esq., Manor House, Hampton; examples of the striking Dracæna Goldiana, and several young plants of Anthurium Veitchii—the large bold-leaved species described and illustrated at p. 773, vol. vi. From Mr. Parker, Tooting, came cut flowers of the fine Tritoma grandis, the large tinted white flowered Heliborus nlger maximus, the sweet-scented Lonicera fragrantissima; the white and rose-coloured plumed varieties of Gynurium argenteum, the white small bell-flowered Arbutus Andrachne, Rosa rubiginosa, with a profusion of its showy coral-red "haws;" Saxifraga (Megarsa) rubra, Aponogon distachyon, Erica codonodes, Gentiana acaulis, Tussilago fragrans, &c. A vote of thanks was accorded. Messrs. Jackson & Son also sent a stand of Japanese chrysanthemums which included two very good flowers in Nait d'Hiver, a brooze-coloured flower of fine form, and La Nympe, a fine pink flower, with a white centre and toothed petal. New Pompon Chrysanthemums in Purpurea odorata, rosy-purple, and Prince of Orange, a bronze-yellow, came from Messrs. E. G. Henderson & Son. Mr. J. Chambers, Westlake Nursery, Isleworth, exhibited several plants of the beautifully cut-leaved Asplenium viviparum. From Mr. Mill, gr. to Lord Rendlesham, Rendlesham Hall, Suffolk, came a grand cut spike of Oncidium æmulum, about 10 feet long, with a dozen brachlets of flowers. A Cultural Commendation was awarded. The useful old Centropogon Lucyaous was well shown by Mr. Ollerbead, gr. to Sir H. W. Peek, M.P.; and the old double white Primula, in fine form, was sent up by Mr. Barron from Chiswick. From Waltham Cross Messrs. Wm. Paul & Son sent up examples of the yellow and orange bearded Hollies, and also specimens of a very glaucous form of Picea nobilis.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. For the number and variety of the subjects exhibited, there has been no more interesting meeting this year than the one which brought the labours of the committee to a close for 1877 on Tuesday last. Included amongst the more noteworthy subjects staged were a group of Pines brought up from Combe Abbey by Mr. Miller, gr. to the Earl of Craven. Five of these were capital examples of Smooth Cayennes, of the aggregate weight of 25 lb.; a very good Enville, and an equally good specimen of a Pine received from Pernambuco, and which some of the members of the committee believed to be identical with the variety grown under the name of Prince Albert. Mr. Miller was accorded a vote of thanks. Mr. J. Muir, gr. to C. R. M. Talbot, Esq., M.P., Margam Park, South Wales, sent an interesting assortment of Citrons, including Shaddocks, Lemons, and several varieties of Oranges, gathered from trees which have been grown at Margam Park for more than 300 years, and some of which are now bearing from 400 to 500 fruits. Mr. Muir stated in a communication accompanying the fruit, that the trees are annually grown out-of-doors from the middle of May until the middle of October, and wintered in houses without any artificial heat. A vote of thanks was passed. Mr. Atkins, gr. to Colonel Lloyd Lindsay, M.P., Lockinge Park, Wantage, showed exceedingly well grown and well preserved samples of Muscat of Alexandria, Black Alicante, and Black Hamburgh Grapes, and was awarded a Silver Medal. A well-finished and exceedingly good flavoured dish of Barbarossa Grapes was contributed by Mr. Wildsmith, gr. to Lord Eversley, Heckfield Place, and a Cultural Commendation was awarded. We have never tasted a better flavoured sample of this Grape, and the Commendation of the committee was well deserved. Mr. Sidney Ford, gr. to W. E. Hubbard, Esq., Leonardlee, Horsham, brought up an admirable collection of three dozen varieties of Apples, all of fine size and high quality. Mr. Skinner, of Boughton Moorhelsea, near Maidstone, also showed a well selected collection of Apples, consisting of varieties usually grown under orchard culture in that district. A fine sample of Blenheim Pippins were shown by Mr. Chambers, Westlake Nursery, Isleworth, and a Cultural Com-

mendation was the award made to them. Mr. Fenn, the Cottage Farm, Sulhamstead, near Reading, also sent a collection of Apples, mostly for identification. Messrs. Veitch's new self-protecting Broccoli was admirably shown by the firm who sent it out, and also by Mr. Wildsmith, and the committee awarded a First-class Certificate—an honour which, according to all accounts that have reached us, the variety in question well deserved. Veitch's Autumn Giant Cauliflower, one of the very best novelties of late years, was also well shown by Mr. Jones, gr. Bently Priory, and by Mr. Gilbert, of Burghley. Mr. Gilbert also sent a couple of brace of Col. Clarke's selection of Telegraph Cucumber, which were of nice size as to circumference, and about 16 inches in length; evidently a grand type. Mr. Roberts, gr. to Baron Rothschild, Gunnersbury, also sent a similar quantity of Telegraph Cucumbers, about 12 inches in length—a very good sample. A fine brace of Tender and True, about 2 feet long, came from J. McIntosh, Esq. (Mr. Taylor, gr.), Duncannon, Weybridge. Mr. Miles, gr. to Lord Carington, received a Cultural Commendation for a fine dish of freshly ripened Tomatos; and Mr. R. Dean, Ealing, was accorded a vote of thanks for a capital sample of the American dwarf purple-topped Turnip.

Messrs. Stuart & Mein, Kelso, again exhibited good examples of their handsome triple-curved Borecole, which was Culturally Commended. Well-grown examples of several fine varieties of Cabbage were brought up from Chiswick by Mr. Barron, and proved a source of considerable interest to the growers present. A cordial vote of thanks to the Chairman was unanimously passed at the conclusion of the usual business.

The Bingley Hall Show, Birmingham.—The twenty-ninth annual exhibition of agricultural stock, roots, corn, implements, poultry and pigeons, has just been held, and the constituent atoms more recently dispersed in all directions. The show opened on Monday and closed on Thursday last. It is no part of our duty to report on such displays in detail, but many of our readers may like to know something about the show, and especially of that portion of it which in part, at all events, may certainly be claimed as horticultural. We need scarcely say we refer to Potatos. There were in this department seventy-six entries, and these, with an exhibit not for competition were represented by three hundred and fifty dishes. The exhibitors came from the counties of Dumfries, Durham, Fife, Nottingham, Leicester, Salop, Kent, Oxford, Stafford, and Middlesex. There were Potatos of two very distinct styles shown: those grown by the painstaking gardener, and those grown by ordinary field cultivation. The contrast was instructive. Of course the gardener had the best of it; though comparing past exhibitions with the present, it is plain that the agricultural mind has been "moved," for there were very few dishes of the ordinary big, coarse ugly tubers usually shown by farmers, such as have almost always predominated heretofore. On the other hand the gardeners have been able to produce quality and weight. It is therefore fairly deducible that these contests are for the public good.

Many sorts of Potatos which of late years have been most frequently exhibited have apparently ceased to occupy the position which they once held with so much firmness. At one time Paterson's Victoria would have been shown in every eligible class; this year it was shown most sparingly, and nowhere in first-rate form. On the other hand, Sutton & Sons' new variety Magnum Bonum has been shown profusely, and in most cases in admirable condition. This is clearly one of the most valuable of new Potatos. We have seen altogether a large number of samples all true to the typical form, and all looking as though they would be acceptable on the dining-table.—Class 17 was for twelve varieties, distinct, twelve tubers of each. First prize, and Messrs. Sutton & Sons' extra prize, a cup, value 5 guineas, was awarded to Mr. Peter McKinlay, Beckenbam, Kent, for a wonderfully level, uniformly excellent exhibit, every tuber of good size and with a general appearance suggestive of having been modelled to order; skin clear and smooth, and no deep eyes; in short, in every respect perfect. The varieties were McKinlay's Pride, a fine new sort; Emperor, Salmon Kidney, Snowflake, Porter's Excelsior, Grampian, Blanchard, Ashtop Fluke, Model, Early Rose, Purple Ashleaf, and King of Potatos. The 21 prize went to Mr. Henry W. Woods, Clipstone Park, Mansfield, for twelve good dishes, consisting of King of Potatos, Blanchard, Porter's Excelsior, Salmon Kidney, Red Regent, Snowflake, Bresee's Peerless, Extra Early Vermont, Flourball, Climax, International Kidney, and Marchioness of Lorne—a very good collection, but lacking the refinement of the premier one. The 3rd prize went to Mr. W. Finlay, the Gardens, Wroton Abbey, Banbury. There were nine exhibitors of twelve dishes.—Class 18 was for eight varieties, of each twelve tubers, four varieties English, and the remaining four American, to include Carter's Breadfruit. The 1st prize, a silver cup, value

5 guineas, given by Messrs. James Carter & Co., London, was won by Mr. McKinlay, with eight capital dishes of Snowflake, Late Rose, Salmon Kidney, Breadfruit, Taylor's Seedling No. 1, Brownell's Superior, International Kidney (very large), and Schoolmaster. The 2d prize went to Mr. James Payne, Stoke Golding, near Hinckley; and the 3d to Mr. W. Finlay. — Class 19, set apart for six varieties, distinct, of each twelve tubers, all the prizes being given by Messrs. J. C. Wheeler & Son, Gloucester. There were ten competitors. Mr. McKinlay was again 1st with tubers equal in quality to those shown by him in the former classes, though rather smaller, the kinds being Blanchard, King of Potatos, Porter's Excelsior, Purple Ashleaf, Grampian, and McKinlay's Pride. Mr. Pickworth was 2d and Mr. Payne 3d. Mr. Thomas B. Thomson, of 20, High Street, Birmingham, provided all the prizes in class 20, for four varieties, distinct, of each twelve tubers. Mr. P. McKinlay was once more 1st, showing Common Walnutleaf, McKinlay's Pride, Garibaldi, and Model; Mr. Woods 2d, Mr. Payne 3d. There were eight competitors. The other classes do not need particularising.

On behalf of Messrs. B. K. Bliss & Sons, of New York, Messrs. Hooper & Co., of London, exhibited about sixty kinds of American-grown tubers. These Potatos were a source of much attraction. They were very prettily staged, and included a number of new varieties, of which no doubt more will be heard by-and-by.

Of other roots but little need be said. The Swedes were uniformly good, the Mangels rather inferior, the season having been too sunless for them. For six specimen long Mangels, Mr. Thomas Penn, Worming Hall, Thame, was 1st, with roots weighing 149 lb. He was also 1st for Globes, with six weighing 121 lb. For Swedes of any variety Mr. C. Tudor, Burntwood, Lichfield, was 1st, with six weighing 81½ lb. The prizes for Ox Cabbages went to Mr. Samuel Robinson, Melbourne, Derby, for his own variety, Champion, for specimens weighing 63½, 56, 52½, 50, 49½, and 48½ lb. There were good exhibits of Carrots, three of the prizes going to the Duke of Portland, and a small show of Wheat, Barley, Oats, Peas, and Beans. The entries of live stock were—cattle, 113, sheep, 69, pigs, 64, poultry, 2077 pens, and pigeons, 629. The display of implements was large, varied, interesting, and instructive. The seedsmen were by far the most important trade exhibitors. Messrs. Jas. Carter & Co.'s large and imposing stand was as attractive as ever. It displayed selected roots culled from their recent show in London, the Potatos being numerous and very interesting, arresting the attention of every one who saw them, many of the tubers looking as though they represented carefully selected and improved strains. Messrs. Sutton & Sons made, as they always do, a most varied and striking exhibition. They showed a quantity of their Magnum Bonum Potato, which fully bore out what we have said above of its excellence. Messrs. Webb & Sons had also a well-filled and attractive stand, and so also had Messrs. Harrison & Sons. Speaking of the exhibition as a whole, it was most satisfactory. There was nothing super-excellent, there was nothing very mediocre; the general average in all departments was thoroughly good.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, Dec. 5, 1877.

Nov. *29.—Dull and wet till afternoon; then fine and bright. Slight rain at times in evening.

* Barometer reading, at 9.25 A.M., 28.670 in.; at 10 A.M.,

Nov. 30.—A fine day, partially cloudy. Cold. Little rain in morning.
Dec. 1.—Overcast, dull day. Wet till 1 P.M. Very dark, gas required from 11 to 11 45 A.M., during which time the wind changed from S. to N.
2.—A fine day. Cold and cloudy. Little rain in early morning.
3.—Overcast, dull, miserable day. Thin rain fell. Cold.
4.—Overcast and dull throughout. Little thin rain in morning and evening.
5.—Overcast, dull day. Slight rain in early morning. Cool.

LONDON: Barometer.—During the week ending Saturday, December 1, in the vicinity of London, the reading of the barometer at the level of the sea increased from 29.21 inches at the beginning of the week to 30.03 inches by the night of November 25, decreased to 29.05 inches by the evening of the 27th, increased to 29.30 inches by mid-day on the 28th, decreased to 28.85 inches by 9 25 A.M. on the 29th, and continued at this reading till about noon, and then increased to 29.64 inches by the end of the week. The mean reading for the week at sea level was 29.38 inches, being 0.24 inch below that of the preceding week, and 0.53 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 53.5 on the 27th to 42.5 on November 25; the mean value for the week was 47. The lowest temperatures of the air observed by night varied from 32 on the 26th to 41.4 on the 27th; the mean for the week was 37.4. The mean daily range of temperature in the week was 9.3, the greatest range in the day being 16.5 on November 26th, and the least 5.5 on December 1.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—November 25, 39.2, -2.4; 26th, 39.8, -1.8; 27th, 47.2, +5.6; 28th, 42.5, +0.9; 29th, 42.4, +0.7; 30th, 42.2, +0.5; December 1, 41.5, -0.2. The mean temperature of the air for the week was 42.1, being 0.5 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 92 on November 28, 91 on the 26th, and 79 on the 30th; but on December 1 the reading did not rise above 58. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 27 on November 26, and 28 on the 25th; the mean value for the week was 32.5.

Wind.—The direction of the wind was S.W., and its strength moderate. The weather during the week was generally dull, cool, and showery. Great gloom prevailed on Saturday, December 1; from 11 A.M. till 11.45 A.M. gas required.

Rain fell on six days during the week, the amount collected was 1.10 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 55 at Truro, 54 at Portsmouth and Plymouth, and 53 at Blackheath; the highest temperature at Sunderland was 47, and at Wolverhampton was 47.5; the mean value from all stations was 50.5. The lowest temperatures of the air observed by night were 26.5 at Eccles, 28 at Nottingham, and 29 at Hull; the lowest temperature of the air at Sunderland was 35, and at Truro, Plymouth, and Portsmouth all 34; the general mean from all stations was 32. The range of temperature in the week was the greatest at Eccles, 22.5, and the least at Liverpool and Sunderland, both 12; and the mean range of temperature from all stations was 18.5.

The mean of the seven high day temperatures was the highest at Truro, 51.5, and Plymouth, 50.5, and the lowest at Bradford, 52.5, and Hull, 43.5; the mean value from all stations was 46.5. The mean of the seven low night temperatures was the lowest at Wolverhampton, 31.5, and at Nottingham, 32.5, and the highest at both Portsmouth and Truro, 40; the mean from all stations was 36.5. The mean daily range of temperature in the week was the least at Bradford, 6.5, and the greatest at Wolverhampton, 13; the mean daily range of temperature in the week from all stations was 10.

The mean temperature of the air for the week from all stations was 41, being 3 lower than the value for the corresponding week in 1876. The highest were 45.5 at Truro, and 44.5 at both Portsmouth and Plymouth; and the lowest were 37.5 at Wolverhampton, 38.5 at Nottingham, and 39 at Hull.

Rain fell on every day in the week at places in the south and south-west of England, and on five or six days at stations in the Midland counties. At Plymouth 2.62 inches fell, at Truro 2.27 inches, and at Brighton 2 inches. At Sunderland 0.40 inch only was measured; and in Yorkshire generally about 1/4 inch was recorded. The average fall over the country was 1 1/4 inch nearly.

The weather during the week was generally dull and showery, and the sky cloudy.

Snow fell at Bradford on Wednesday, November 28

SCOTLAND: Temperature.—The highest temperatures of the air observed by day were 55 at Truro, 54 at Portsmouth and Plymouth, and 53 at Blackheath; the highest temperature at Sunderland was 47, and at Wolverhampton was 47.5; the mean value from all stations was 50.5.

ratures of the air observed by day varied from 48 at Leith to 44 at Dundee; the mean value from all stations was 46.5. The lowest temperatures of the air observed by night varied from 29 at Aberdeen to 34 at Greenock; the mean value from all stations was 31.5. The mean range of temperature from all stations was 15.5.

The mean temperature of the air for the week from all stations was 38.5, being 2.5 higher than the value for the corresponding week in 1876. The highest was 39.5, at Glasgow, and the lowest 37.5, at Dundee.

Rain.—The falls of rain varied from 2 1/2 inches at Aberdeen to a quarter of an inch at Leith. The average fall over the country was 1 inch.

DUBLIN.—The highest temperature was 53, the lowest was 33, the range 19.5, the mean 41, and the fall of rain 0.10 inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.

277. UNFRUITFUL PEAR TREES.—Can any of your correspondents inform me of the best mode of treatment to produce fructification in some pyramid Pears, which grow and bloom freely year after year, but bear no fruit? They were removed five years ago, and root-pruned two years back, and are about ten years old. They have been well and scientifically pruned. G. P. D., Watford. [What about the situation? EDS.]

218. GLASS OR CHROMATIC BEDS.—Can any of your correspondents inform me where materials can be obtained for the glass or chromatic beds invented by Mr. Nesfield many years ago? Is there any published description of them? W. R.

219. WALNUT TREE BLEEDING.—A few years ago I had to cut a Walnut tree which hung too much over the drive. It was done in winter, but still it bled so much that I feared injury to the tree. This year I must cut it again. Is there anything I can apply to the branch to stop the bleeding? D. K. M. [Try painter's knotting, or Thomson's Styptic. EDS.]

Answers to Correspondents.

ADDRESS: W. P. K. Mr. Jones, The Royal Gardens, Frogmore, Windsor.

AGARICUS CAMPESTRIS: Young Gardener. Certainly it is, and the best of all. Your informant is a dunce.

BOILER: H. R. H. We cannot answer your question without knowing more of the circumstances under which you are placed, but we should think it most likely an ordinary saddle boiler will suit you best.

BOOKS: Young Gardener. The best Gardener's Dictionary, by which we suppose you mean a plant catalogue, is Paxton's Botanical Dictionary (25s.), published by Messrs. Bradbury & Co.

DENDROBIUM ALBUM: J. M. Rockhouse. The true D. album is an East Indian species.

CAMELIAS: H. B. The cause of the buds dropping cannot certainly be determined without fuller knowledge of all the conditions. If they have not been too dry at the root, they have probably been subjected to too dry an atmosphere, and perhaps too much heat.

CHAMECLADON OBLONGIFOLIUM: J. T. R. We do not know the plant, nor can we find any reference to it.

CYPRIPEDIUM INSIGNE: J. L. P. Yes. Very good. DACTYLIS GLOMERATA: E. O. Not uncommon in wet autumns.

ELEMENTARY BOTANY: H. R. H. Botany for Beginners (Bradbury & Co.), Oliver's Lessons in Elementary Botany (Macmillan).

ELRUGE AND VIOLETTE HATIVE NECTARINES: H. M. E. The difference between these two varieties is to be found in the colour of the flesh round the stone; that of Elruge being white, and of Violette Hative red. They are distinct, but those who grow one do not want the other.

EUONYMUS AS GAME COVER: J. H. We have no experience, but should not think it a very desirable subject. But you do not state which Euonymus you refer to—the evergreen or deciduous.

EUONYMUS JAPONICUS: Z. Z. The variegated varieties of this plant all strike equally well from cuttings under a hand-glass. Of those you mention that named ovata aurea would be the freest grower.

EUFATORIUM WEINMANNIANUM: A. H. H. Yes. FRUIT TO NAME: A. F. Your Apple is unknown to us.

FUNGUS IN TURF: E. P. F. It is impossible to say to what fungus the Mycelium belongs. As it is taken from rings, it may possibly be the spawn of the Fairy-ring Champignon, or of Agaricus geotropus.

GARDENERS' ROYAL BENEVOLENT INSTITUTION: R. Craig. Write to Mr. Cutler, the Secretary, 14, Tavistock Street, Covent Garden, W.C.

HEATING GREENHOUSE: T. E. Mr. Shrewsbury's or Mr. Trotman's apparatus, frequently advertised in our columns, would probably suit your purpose, as gas is not available.

HYACINTHS: J. F. The roots of your Hyacinths appear to be rotting from too much wet. The soil is unnecessarily heavy, and we understand you to say that the pots have been set out-of-doors under a covering of ashes, and probably on a hard bottom,

which has prevented the heavy rains while passing downwards to get clear of the bottoms of the pits. We are the more inclined to adopt this explanation from the fact that you mention having been similarly unfortunate last year—both autumns having been notable for their exceptional rainfall.

NAMES OF PLANTS: C. E. F. Cupressus macrocarpa.—M. P. 1, Thuja occidentalis Vervainiana; 2, Cryptomeria elegans; 3, Retinospora pisifera plumosa; 4, Juniperus macrocarpa.—G. Ward. 1, Pedicularis palustris; 2, Campanula rotundifolia.

PINE-PIT: J. H. The four rows of 4-inch piping would supply sufficient atmospheric heat, but they would not also supply bottom-heat, as the arrangement you describe seems to show you desire them to do. You will not get the bottom-heat from any number of pipes thus exposed.

POTASH: Ignoramus. We should prefer to use wood-ashes, or if potash salts to mix them with superphosphate or guano. Potash is an indispensable plant food, but it is better used in combination with other ingredients.

STANDARD CHRYSANTHEMUMS: J. M. Rockhouse. It was an error, of course. Read inches for feet.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED:—Messrs. Lévêque et Fils (26, Rue du Liégar, Ivry-sur-Seine, Paris), Catalogue of Roses, Camellias, Azaleas, Florists' Flowers, &c.—Messrs. Dicksons & Co. (1, Waterloo Place, Edinburgh), Catalogue of Forest and Ornamental Trees and Shrubs, Coniferæ, Rhododendrons, &c.—Messrs. Rodger, McClelland & Co. (Newry), Catalogue of Evergreen and Deciduous Trees and Shrubs.—Messrs. Putz & Roes (50, Great Russell Street, London, W.C.), Catalogue of Seeds, Plants, Florists' Flowers, &c.

COMMUNICATIONS RECEIVED.—D. S.—E. C.—F. N.—J. H.—G. L.—H. C., jun.—J. McL.—J. B.—G. N. T.—T. S. J.—J. C.—J. McC.—Observer.—R. G.—G. B.—W. B.—J. R. J.—A. H. H.—L. B.—T. D. M.—T. W.—One in a Fog (we cannot interfere. It is a question for the committee to deal with).—A. F.

Markets.

COVENT GARDEN, December 6.

Our market still remains quiet. Supplies of all classes of goods coming short, but prices remain much the same. The stock of French Pears is now nearly exhausted, and good samples of English fruit would realise better prices. No alteration in Kent Cobs. James Webber, Wholesale Apple Market.

CUT FLOWERS.

Table listing various cut flowers and their prices, including Abutilon, Azalea, Bouvardias, Carnations, Chrysanth, Cornflower, Epiphyllum, Eucharis, Gardenia, Heliotropes, Hyacinths, etc.

PLANTS IN POTS.

Table listing various plants in pots and their prices, including Azalea, Begonia, Bouvardias, Camellia, Chrysanth, Clematis, Cyperus, Dracena terminalis, Erica Hyemalis, Ficus elastica, Foliage Plants, Fuchsia, Liliurn in var., Mignonette, Myrtle, Palms in variety, Pelargon, Solanums, etc.

VEGETABLES.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Herbs, Horse Radish, Lettuce, Mint, Mushrooms, Onions, Parsley, Radishes, Spinach, Tomatoes, Turnips, etc.

Potatos:—Essex Regents, 90s. to 110s.; Kent Regents, 100s. to 140s.; Kent Kidneys, 140s. to 160s.

FRUIT.

Apples, per 1/2-sieve	s. d. s. d.	Oranges, per 100	s. d. s. d.
Grapes, per lb.	1 6-5 0	Pears, per doz.	2 6-12 0
Lemons, per 100	8 0-12 0	Pine-apples, per lb.	1 6-6 0
Nuts, Cobs, per lb.	0 4-0 6	Walnuts, per bushel	5 6-8 0

SEEDS.

LONDON, Dec. 5.—A quiet tone has this week marked the trade for farm seeds. As regards Red Clover the position is unchanged; in English seed nothing of importance yet offers, whilst the supply of French is fully adequate to present requirements. The Americans do not yet exhibit any great anxiety to make sales; rightly or wrongly they seem convinced that the shipments from France must sooner or later come to an end, and that then England will have to rely for her wants upon the United States. The Western farmers are, from all accounts, tenacious holders, and with their pleasant memories of last year's high and remunerative rates, they are loth as yet to let go their produce at figures consonant with the sober views obtaining in this country. Some letters just received from Chicago speak of the Illinois crop as having been greatly over-estimated. In about ten days' time samples may be expected here of the new Canadian Clover. Of home-grown red the yield is said to prove unsatisfactory, the average quantity per acre being only from 1 to 2 cwt. White Clovers and Alsikes are steady at the late advance. Hardly any offers come to hand of foreign Trefoil, and stocks of English are extremely small; quotations, in consequence, show great firmness. For full samples of Rape and Mustard buyers are found at full prices. Canary seed moves off slowly on unaltered terms. In Linseed there is no movement in value, and very little in demand; other articles in the lack of transactions afford no subject for remark. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Trade at Mark Lane on Monday was dull, and the tendency of prices downwards. English and foreign Wheat, excepting, however, American, was cheaper to sell; in some instances a reduction of 1s. per quarter was submitted to. Barley was fairly well held, although in the absence of business it was no easy matter to support the quotations of last week. Malt was quiet on former terms. Oats and Maize were reported unaltered from Monday evening, but the tone as regards both was weaker. Beans and Peas were as before. In flour quotations favoured purchasers.—Trade showed no improvement on Wednesday, indeed the tone of business was even worse. Wheat and flour, where pressed for sale, were decidedly cheaper, and prices were not very well supported for other classes of produce. The supplies of foreign grain were liberal, except, perhaps, as regards Maize.—Average prices of corn for the week ending December 1:—Wheat, 51s. 7d.; Barley, 44s. 2d.; Oats, 24s. 11d. For the corresponding period last year:—Wheat, 48s. 4d.; Barley, 39s.; Oats, 24s. 11d.

CATTLE.

At the metropolitan market on Monday there were a larger number of beasts than for a long time past. A considerable proportion were of inferior quality, consequently choicest kinds were in demand at fully late rates. There was a good show of American oxen, which made a great price. Trade was dull for second-rate qualities. There were enough sheep sent forward for the demand, which was very limited, and our top quotation is quite the extreme. Trade was dull for calves, and prices on the average lower. Quotations:—Beasts, 4s. 8d. to 5s. 4d., and 5s. 8d. to 6s. 2d.; calves, 5s. to 6s. 2d.; sheep, 5s. 4d. to 5s. 8s., and 6s. 4d. to 7s.; pigs, 3s. 8d. to 4s. 8d.—On Thursday trade was dull. Both beasts and sheep sold slowly, and prices tended in buyers' favour. Calves were a quiet sale.

HAY.

At Whitechapel on Tuesday there was a fair supply of fodder, the demand for which showed improvement on last week. Prices were unaltered. Prime Clover, 100s. to 135s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 100s.; inferior, 70s. to 85s.; and straw, 44s. to 54s. per load.—At Thursday's market a rather short supply of fodder was on sale. There was a dull trade at Tuesday's prices.—Cumberland Market quotations:—Superior meadow hay, 100s. to 108s.; inferior, 80s. to 90s.; superior Clover, 122s. to 140s.; inferior, 100s. to 112s.; and straw, 54s. to 58s. per load.

POTATOS.

The Borough and Spitalfields markets reports state that the supplies are in excess of the demand, and quotations consequently droop. Kent Regents, 150s. to 160s.; Essex ditto, 140s. to 155s.; rocks, 100s. to 120s.; kidneys, 120s. to 140s.; flukes, 160s. to 180s.; Victorias, 150s. to 180s. per ton.—The imports into London continue to be upon a large scale. During last week 144,920 bags were received from Hamburg, 14,416 Antwerp, 13,956 Bremen, 6539 Ghent, 4695 Harlingen, 2191 bags 114 tons Brussels, 2581 bags Louvain, 2160 bags 45 tons Dunkirk, 920 bags Boulogne, 885 bags 42 packages Rotterdam, and 535 bags Rouen.

COALS.

There was a large supply of house coals at market on Monday, and sales being pressed, prices gave way 1s. per ton. There was no recovery on Wednesday. Quotation:—Hastings Hartley, 15s. 9d.; Walls End—Hawwell, 18s.; Hetton, 18s.; Hetton Lyons, 15s. 9d.; Hawthorns, 15s. 9d.; Lambton, 17s. 6d.; South Hetton, 18s.; Tunstall, 15s. 9d.; Vane, 15s. 9d.; South Hartlepool, 16s.; Tees, 17s. 6d.

NOTICE to the SEED TRADE.

EXTRACT FROM
CARTER'S LIST of NOVELTIES
For 1878.

VICK'S CRITERION TOMATO.

First-class Certificate Royal Horticultural Society.
REPORT OF TRIALS OF TOMATOS AT CHISWICK (Royal Hort. Cultiva Society's Gardens).—Vick's Criterion (New Improved) is a large smooth ovate variety, of a distinct rosy crimson-colour; free fruiting."
Electros, price 15s.

CARTER'S CHALLENGER PEA.

From Mr. WHALLEY, Head Gardener to His Grace the Arch bishop of Canterbury.
"Carter's Challenger is the best Pea we have yet grown; it will become a very great favourite, particularly with market gardeners, as it requires no stakes, and grows well; also a very beautiful Pea, fine for exhibition."
Electros, price 7s.

NEW SWEET PEA—VIOLET QUEEN.

It is dwarfier in habit than the other varieties, and the seed is also quite distinct in appearance, the flowers ranging in colour from deep mauve to light violet, suggestive of the beautiful Bougainvillea.
Electros, price 6s.

TWO NEW MELONS.

CARTER'S PINE CREAM MELON.

First-class Certificate Royal Horticultural Society.
Distinct in seed, appearance, and flesh.
Electros, price 3s. 6d.

KHIVA MELON.

We think this Melon will be found to be identical with the variety referred to by Captain Burnaby in his *Ride to Khiva*, p. 278, who speaks of the Khiva Melon as follows:—
"The Melons here have a fame which is celebrated all over the East. . . . The taste is so delicious that any one only accustomed to this fruit in Europe would scarcely recognise its relationship with the delicate, highly perfumed Melon of Khiva."
Mr. A. McARTHUR, Head Gardener to H.R.H. Prince Dhuleep Singh.
"Your Khiva Melon is a very good one; it is medium sized this skinned, melting and juicy; the flesh is green, very prolific, and quite distinct."

CARTER'S LITTLE WONDER PEA.

A wrinkled Marrow, as early as Advancer, and quite equal in length and breadth of pods, productiveness, and flavour to G. F. Wilson, or the finest type of Veitch's Perfection."
From the *Gardeners' Chronicle*, July 21, 1877.
"Messrs. James Carter & Co. showed a new Pea, named Little Wonder, very dwarf, a great bearer, with the pods large and straight, and Peas of capital flavour."
Electros, price 10s.

CULVERWELL'S TELEGRAPH PEA.

This is an extraordinary acquisition, the Peas often being so close together as to appear to be forming a double row in the pod. It is likely to be the forerunner of a new type of this indispensable summer vegetable.
From Mr. J. GOODACRE, Head Gardener to the Right Honourable the Earl of Harrington.
"Culverwell's Telegraph Pea is the longest and handsomest Pea grown, very productive, and excellent quality; a vigorous constitution; quite free from mildew; just the Pea for exhibition."
Electros, price 7s.

For further particulars and other Novelties see above List, just published.

Several Prizes of considerable money value will be offered for some of these Novelties at the Preston and London Shows of the Royal Horticultural Society; for particulars see "Novelty List."

THE QUEEN'S SEEDSMEN,
HIGH HOLBORN, LONDON, W.C.

THE
Royal Norfolk Seed Establishment.

READY JANUARY 1,

THE
ILLUSTRATED GUIDE
FOR
AMATEUR GARDENERS,
Spring, 1878.

Containing 116 pages of beautifully illustrated Letterpress, complete Directions for the successful Management of the Kitchen Garden and Flower Garden throughout the year, with Original Articles on the Cultivation of various Flowers and Vegetables, a Select List of Choice Kitchen Garden and Flower Seeds, Lilies, Gladioli, Seed Potatos, &c. Also a superbly finished Coloured Plate, the whole enclosed in a charmingly beautiful Cover of a new and elegant design.

This will be found by far the most splendid and useful Seed Catalogue ever published, and should be read by every one having a Garden.

Price 1s., post-free. Gratis to Customers.

OPINIONS FROM THE PRESS.

"For a long time Messrs. Daniels Brothers have been noted for their exquisite taste in design and colour manifested by their Catalogues, and we have to say of their *Illustrated Guide for Amateur Gardeners* for the present spring, that it is quite up to the high standard which this firm aims at." *The Farmer.*

"This is the most tasteful and best executed thing of the kind we ever remember having seen." *The Country.*

"Profusely illustrated, and the coloured plates are quite beyond the average of book illustrations." *Liverpool Mercury.*

DANIELS BROTHERS,
THE QUEEN'S SEEDSMEN,
NORWICH.

All the above have recently been transplanted, and will rise with fine roots.

CATALOGUES free on application.

WILLIAM IRELAND, Piton Nurseries, Barnstaple.

WELLINGTONIA

gigantea pendula nova.

LITTLE & BALLANTYNE,
CARLISLE,

Were awarded the first prize for "a new Conifer of real merit," at the International Horticultural Exhibition at Carlisle last September, and they are now sending out

Plants from £2 2s. to £5 5s. each.

This Wellingtonia has a perfectly distinct habit from all others, and has been noticed and described in the leading horticultural journals, and advertised by us for some time back. Since we were awarded a prize for our plant others are advertising Weeping Wellingtonias, which are perfectly distinct in habit from ours, the original plant of which may be seen at any time in our Nurseries at Knowfield, and is now 6 feet 6 inches in height, having never altered its character.

LITTLE & BALLANTYNE,

KNOWFIELD NURSERIES,

CARLISLE.

New Violas.

L. PAILLET, NURSERYMAN, Chatenay les Sceaux, pres Paris, has the pleasure to offer the fine and splendid double white **VIOLA, BELLE DE CHATENAY**, sent out by him last season. Prices for the present season will be as follows:—12s. per dozen, £4 per 100; for good strong plants, full of bud flowers, £1 per dozen, £7 per 100.

L. PAILLET has also to offer:—
The fine **VIOLA CZAR**, with large pure white flower, at 3s. per dozen, £2 per 100; strong plants, full of flower, 12s. per dozen, £4 per 100.

VIOLA MARIE LOUISE, splendid large double flower, of deep blue colour, centre of flower white with a red spot; 10s. per dozen, £3 per 100; strong plants, full of flower, 12s. per dozen, £4 per 100.

N.B.—For other varieties, new and recommendable, see Catalogue and Descriptive List.

CLEMATIS MADAME EMILE SORBET, immense flower, perfect form, round petals, flowers of deep blue sky colour; young plants, 12s.; strong plants, 18s.

CLEMATIS DUCHESSE DE CAMBACÉRÈS, very large flower, good form, white stamens, flower light blue colour; price, young plants, 10s.; strong plants, 15s. These two varieties are sent out for the first time this season.

WISTARIA SINENSIS FLORE-PLENE.—This variety, introduced from America, is quite like the old, well-known variety, but the flower is double; very fine novelty. Price, 15s. each, £5 per six plants, £5 per dozen.

WELLINGTONIA GIGANTEA PENDULA and **AUREA VARIEGATA**.

For description and price see Catalogue and List of Prices, sent on application. This Catalogue, published in the English language, contains the List of Prices of STOCKS, TREES, and PLANTS cultivated by the establishment, such as Fruit Tree Stocks of every description, Fruit Trees, young Seedling Forest Trees, young Seedling Ornamental Trees and Shrubs, Palmettes, Rhododendrons, Magnolia Lemé and others, Roses, Rose Stocks, Conifers, Evergreens, *Laurus latifolia*, Bulbous Plants, &c.

Orders may be sent direct, or to my Agents, Messrs. **SILBERRAD AND SON**, 15, Harp Lane, Great Tower Street, London, E., where Catalogue and List may be obtained on application.

SPECIAL OFFER TO THE TRADE.

We can supply Foundation Plates—which form Ash-pit—and Smokestacks, if wanted, thereby doing away with the necessity for even a single brick in their erection.

	A	B	C	D	E
	s. d.	s. d.	s. d.	s. d.	s. d.
Foundation Plate ..	35	0	45	0	60
Smokestack, Damper, and Soot-Door ..	30	0	30	0	40
Furnace and Ash-Pit, Frame and Doors; also Furnace Bars, Bearers, Dumb-Plate, &c. ..	30	0	40	0	50

Foundation Plates are arranged to heat the air before it is sent into the ash-pit at back, and furnace-doors to heat the air before its admission into the furnace, furnishing in fact two "hot-air" blasts to the furnace; the admission of large volumes of cold air being most injurious to the economical working of the furnace.

In preparation an entirely NEW SERIES of SEVENTY BOILERS, embracing a large variety suitable for small places, &c., and all specially adapted for low situations where shallow boilers are a necessity. Particulars on application.

WM. WRIGHT & CO., AIRDRIE, N.B.

Indestructible Terra-Cotta Plant Markers. MAW AND CO.'S PATENT.—Prices, Printed Patterns, and Specimens, sent post-free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c. MAW AND CO., Bentball Works, Broseley.

MR. MECHE'S ADDRESS to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—

"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-strop trade was immense; now moustache and beard are the order of the day, and the razor and strop trade is comparatively defunct. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody travels by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor geese supplied our pens, and many a now rich merchant in the City will remember the quality of Mechi's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worked press? and how much less time is occupied in sipping port wine, as we used to do fifty years ago, when we could not travel? Steam will make our 4 lb loaves cheaper some day, just as it has converted calico from 2s. 6d. to 6d. or less per yard. Then, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to business: fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the strop and paste, which I personally invented, can testify to this; in fact, it was sometimes complained of that I stamped on my razors 'Exchanged if not approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, and in the tasteful selection of articles suitable for presentation, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our sportsmen remain, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street,—1877.

HORTICULTURAL WINDOW GLASS.

For Heating Conservatories, Greenhouses, Halls, Shops, and Places without chimneys. The Stoves burn with one supply of Fuel 12 to 24 hours, requiring no attention or re-filling.
NASH'S PATENT PORTABLE VAPOUR BATH and BRONCHITIS KETTLES, with Medical Testimonials.
Fretwork and Carving Tools, Saw Frames, Saws, Patterns, and Prepared Wood, &c.
S. NASH, Tool Warehouse, 119, Newgate Street, E.C., and 253, Oxford Street, London, W. Prospectus free.

JOSEPH BRAMHAM, HORTICULTURAL and HOT-WATER ENGINEER, WIRE WORKER, WEAVER, &c., 104, Dale Street, and 44, Elizabeth Street, Liverpool.
J. B. strongly recommends the ALLERTON PRIORY BOILER as one of the most powerful for extensive work. He has fixed one capable of heating 10,000 feet of 4-inch piping. See *Gardeners' Chronicle*, p. 647. Also his WELDED WROUGHT IRON WATERWAY BACK for ordinary Saddle Boilers. These Backs can be fixed to any Boiler now in use, and are a great saving in fuel and labour. He is also prepared to fix any kind of Boiler made.
Manufacturer of the Registered LIVER FRONT for large Boilers, IRON and WIRE WORK in all branches. References from Noblemen and Gentlemen for work done.
Plans and Estimates given.

SILVER MEDAL

AWARDED AT
Birmingham Meeting,
Royal Agricultural Society,
1876.

1876.

HIGHEST HONOR

AT THE
Centennial Exhibition,
Philadelphia.

Specially adapted for Pumping in
Gentlemen's Houses and Grounds.
No Labor Required.

HAYWARD TYLER & Co.,
84, WHITECROSS STREET, LONDON.

CRITCHLEY'S PATENT HEAT REGULATOR,

AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot Water. E, F, Pipes for Return of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler. The following Testimonial has been received:—

“Berkeley Castle, April 13, 1875.
“Gentlemen, — I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve: in fact, I think it the greatest improvement that has come out for horticultural purposes.
“I am, Gentlemen, yours truly,
“R. H. CROOK,
“Gardener to the Right Hon. Lord Fitzhardinge.”

Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the Kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

Messrs. CRITCHLEY & CO.,
Horticultural Engineers and Builders,
GROSVENOR WORKS, CHELTENHAM.

GEORGE'S PATENT CALORIGEN,

FOR
Warming and Ventilating Small
Conservatories.

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory.

Made in Wrought Iron, 43 3/4 inches.
Height, 28 inches; diameter, 14 inches.

It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).

Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E. C.
This Stove introduces a strong current of warmed (not burnt) fresh air.

STEVENS'

TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.

“Royal Exotic Nursery, the Road, Chelsea, S.W.—Aug. 8, 1877.
“GENTLEMEN,—In reply to your enquiry as to our opinion of your Stevens' Treatham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Treatham Boiler, and we have now *thirteen* of various sizes at work.
“For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Treatham Boilers supplied by you, and we have never felt so little anxiety in connection with our hothouses during the cold winter months as we do now.
“We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.
“We are, Gentlemen, yours faithfully,
“JAMES VEITCH AND SONS.”

For Illustrations, with full particulars, apply to the Sole Makers,
F. & J. SILVESTER,

HOT-WATER ENGINEERS, &c., &c.,
Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

GARDENER (HEAD).—Age 25, single; good experience in Early and Late Forcing, Fruits, Flowers, Flower and Kitchen Gardening. Good references.—T. C., Mr. Southern, Shardlow, Derby.

GARDENER (HEAD, good), where two or more are kept.—Age 34, married; understands Vines, Stove and Greenhouse Plants, Flower and Kitchen Gardening, also Early and Late Forcing. First-class testimonials.—P. P., Messrs. E. P. Francis & Co., Nurseries, Hertford, Herts.

GARDENER (HEAD), middle-aged, married, no family.—J. SIMPSON, Gardener to the Earl of Wharcliffe, Wortley Hall, Sheffield, can recommend an excellent man as above; thirteen years in former situation, left through the estate being sold. First-class testimonials as to character and ability.

GARDENER (HEAD).—Age 30; fifteen years' character from former and present employer. My employer will allow any Gentleman wanting a Gardener to inspect the gardens of which I have the entire management, including Glass in every department, Kitchen and Flower Gardens, Parks, Plantations, and the usual routine of a gentleman's place.—R. W., Goldsmith's Park, Tunbridge Wells.

GARDENER (HEAD), where three or four are kept; age 28.—The Advertiser can with confidence strongly recommend his Foreman to any Lady or Gentleman requiring the services of a thorough practical Man; twelve years' experience; very respectable.—Mr. D. POWELL, Gardener to the Right Hon. the Earl of Devon, Powderham Castle, Exeter.

GARDENER (HEAD), age 31.—R. SLIGHT-HOLM, Farfield House, Armley, Leeds, offers his services to any Lady, Nobleman, or Gentleman requiring a really competent person as above; well up in the Cultivation of all kinds of Fruits, Flowers, Plants, and Vegetables, Early and Late Forcing; also understands Land and Stock. Excellent reference.

To Noblemen and Gentlemen.

GARDENER (HEAD), in a good Establishment, where at least three or four are kept, and where a thorough practical Man is wanted.—Age 41, married; understands the Management of a small Home Farm. High-class testimonials, and long personal character. No small place treated with.—H. D., Webster, Stationer, Falcoo Road, Clapham Junction, S.W.

GARDENER (HEAD, WORKING).—Age 30, married; thoroughly experienced in the Management of a good Garden. Can be highly recommended.—H. T., 2, High Street, Somersetown, Chichester.

GARDENER (HEAD, WORKING).—Age 31, single; thoroughly understands Stove and Greenhouse Plants, Vines, Peaches, Melons, Cucumbers, Flower and Kitchen Gardening. Five years' good character.—G. D., H. Sprigings, Orchard Street, St. Albans, Herts.

GARDENER (SECOND, or good SINGLE-HANDED).—Age 24; understands Vines, Stove and Greenhouse Plants, and Kitchen Gardening. Two years' good character.—T. G., Oak Lawn, The Glebe, Lee, Kent.

GARDENER (UNDER), in a Gentleman's Garden.—Age 21. Good character from last situation.—G. B., Manor Villa, Burgesshill, near Hayward's Heath, Sussex.

GARDENER (UNDER, or JOURNEYMAN), in a good Garden, Kitchen Garden or Pleasure Ground, with opportunity of seeing General Gardening.—Age 21; a good hand with Scythe. To live in both preferred. Good character. Leaving through the breaking up of establishments. Reference to be made to Mr. Batters, Gardener.—THOMAS HARRIS, The Gardens, Chilworth Manor, Romsey, Hampshire.

To Nurserymen.

GENERAL FOREMAN or SALESMAN.—Twelve and a-half years' experience in general Nursery work; thorough knowledge of Stove and Greenhouse Plants. Six and a-half years with Messrs. J. Veitch & Sons, and for the past five years Foreman and Salesman in the Stove Plant Department.—J. B., 3, Dudmaston Terrace, Stanley Bridge, Chelsea, London, S.W.

To Market Gardeners, &c.

SALESMAN, GARDENER, or FOREMAN.—Young; has had long experience in Covent Garden Market, also in Market Gardening.—Apply by letter to A. B., 1, Hume Villas, Arragon Road, Twickenham, S.W.

MANAGER, or GENERAL FOREMAN, in a Nursery.—Age 37; well up in Roses, Gardening, Stephanotis, &c., in quantity; Fruit and General Forcing, and routine of a general compact Business.—X., 1, Nelson Grove, Merton, S.W.

PROPAGATOR, or PROPAGATOR and FOREMAN.—Age 30, married; thoroughly understands the profession. First-class references. Country preferred.—T. J., 8, Lahore Road, Croydon, Surrey.

PROPAGATOR, or PROPAGATOR and FOREMAN (INDOOR).—Age 24; ten years' experience. Good reference.—A. Z., Post-office, Edgware, Middlesex.

TO GENTLEMEN, NURSERYMEN, FLORESTAS, &c.—Wanted by a married Man, age 40, Management of Land and Stock, or Glass Erections for Plant and Cut Flower Growing for Market and other purposes, thoroughly experienced in Rearing and Selling all kinds of Stock, Farming in all branches, and Accounts generally, with Growing and Selling Stove and Greenhouse Plants, &c., for Market and other purposes. No objection to take management of any new Glass Erection, to open a Business for a Gentleman, &c. Every reference given and security if required.—H. W. B., London Road, Cheltenham.

AGENT in LONDON (Agri-Horticultural).—The Advertiser, who has had many years' experience among the leading English and Continental Houses connected with the above, and who has during the past seven years transacted the London Business of a well-known Provincial firm retiring at Christmas next, is open to arrange with another house of good standing in a similar capacity, either at his present office, situate in the very centre of the City, or elsewhere, or would accept Resident Country Agency of House or Landed Property, and give accurate returns of all receipts and disbursements pertaining thereto. Unexceptionable references given and required.—CURATOR, *Gardeners' Chronicle* Office, W.C.

To Guano, Seed Merchants, Nurserymen, &c.

TRAVELLER.—GEORGE B. COCKS, who for many years represented the late firm of Peter Lawson & Son, and Inspected their Manure Agencies in the West, also subsequently representing the Lawson Seed and Nursery Company (limited), is desirous of an engagement with any respectable firm as TRAVELLER in the above branches; is thoroughly well up in Seed Growing, and has also a knowledge of Agricultural Machinery. Would not object to do America and the Continent.—The Old Nurseries, Donington, Spalding, Lincolnshire.

BOOK-KEEPER, or MANAGER, in a Provincial Seed or Nursery Business.—Age 25. Good references.—F. N., C. Berry, 29, Paternoster Square, Paternoster Row, London, E.C.

SHOPMAN, or TRAVELLER.—Age 33; accustomed to the road; long practical experience in every department of the Seed Trade. Highest references.—T. E., 18, Percival Street, Ardwick Green, Manchester.

TO SEEDSMEN, &c.—A young Man, with seventeen years' experience, desires a situation; has served as Warehouseman, Shopman, Traveller, and Ryegrass Buyer, for best houses in the Wholesale and Retail Trade. Moderate salary expected. Is a Teetotaler.—G. M., 4, Duncairn Terrace, Belfast.

CLERK, in the Nursery or Seed Trade.—A young Man of first-class experience, a good Correspondent and Book-keeper, and could Travel if required.—M. N., *Gardeners' Chronicle* Office, W.C.

STEWARD, MANAGER, or BAILIFF.—Re-engagement wanted at Lady-day; has had great experience upon large estates. Seven years in present situation: 2000 acres. The highest references to character and ability.—A., 18, Mill Street, Maidstone, Kent.

KINAHAN'S LL WHISKY.

Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

GRATEFUL—COMFORTING.

JAMES EPPS & CO.

HOMOEOPATHIC CHEMISTS.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, COLIC, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS.—Mind and body are so closely intertwined that for the former to be vigorous the latter must be healthful. The first step towards the maintenance of health is to secure perfect digestion, which is readily obtained by this noted medicine, the most competent effectually to restrain every adverse influence which can mar, impair, or vestiviously modify this all-important process. The student, merchant, man of pleasure, and humble labourer, each in turn derive vigour, ease, and strength from occasional doses, or a longer course, of Holloway's purifying Pills. However wavering the mind, or unstrung the nerves, this fine medicine will track the derangement to its source, where it will overthrow it and establish order and purity in its place.

Pre-eminent among Boilers is
**WEEKS'S PATENT DUPLEX UPRIGHT
 TUBULAR BOILER,**
 WITH PATENT DIAPHRAGM AND FUEL ECONOMISER.

Invented in 1844.
 There are upwards of
Three Thousand
 of these **Boilers** in
 operation.

Patented for **Im-**
provements in 1869.
 They are working the
largest Hot-water
Apparatuses in
 existence.

The **Patent Fuel**
Economiser, added
 in 1874, effects a saving
 of at least **15 per**
cent.

No Boiler can boast
 such a **long** and **suc-**
cessful career.

Weeks's Patent Du-
 plex Upright Tubular
 Boiler with Fuel Econo-
 miser combined may
 be justly styled the
"Champion of the
World" for heating
 by Hot Water.

We **guarantee**
 these Boilers for **10**
years when fixed by
 ourselves.

Full particulars and Illustrated Sheet post-free on application.

FREDERICK PERKINS can with confidence recommend the above Evergreens to remove any distance, being all transplanted springs, 1877.

Regent Street, Leamington.

CHARLES SHARPE & CO., SEED MERCHANTS AND GROWERS, SLEAFORD,

Beg to call attention to the following NOVELTIES:—

THE RAUCEBY HALL MELON.

This splendid new Green-fleshed Melon has been raised by Mr. Brown, the gardener at Rauceby Hall, and has during the past two seasons been exhibited seventeen times—in every case gaining a First Prize. It is hardy, a fine setter, and a very heavy cropper. The fruit is very beautifully netted, the flesh juicy, sweet, and melting, and of a very rich flavour. Altogether it is a variety of unquestionable superiority, and worthy a place in every garden.

Price, 2s. 6d. per Packet.

TESTIMONIALS.

From W. INGRAM, Esq., Belvoir Castle Gardens.

"Dear Sir,—The Green-fleshed Melon exhibited by Mr. Brown at the Sleaford Show this year, and to which the First Prize was awarded, was of exceptional excellence, having a rich flavour, and being sweet, melting, and very juicy.
"I am, yours truly,
"November 21, 1877.

"W. INGRAM."

From Mr. JAMES BROWN, Rauceby Hall Gardens.

"Dear Sir,—My Seedling Green-fleshed Melon has a very hardy constitution, it is a very free setter and immense cropper, beautifully netted, and unquestionably the handsomest and finest flavoured Melon grown, averaging from 3 to 4½ lb. in weight. I have exhibited myself several times, and it has never been beaten. You can safely recommend it to be the very best Melon ever sent out, and the entire stock is in your hands.
"I am, dear Sir, yours truly,
"November 12, 1877.

"JAMES BROWN."

From Mr. C. BILLESON, Syston Park, Grantham.

"Dear Sir,—I have tasted, and also seen growing, the Melon called Rauceby Hall Seedling, and I believe it to be a really first-class Melon, most delicious in flavour, free setter, and a very robust constitution. It is medium in size, thin rind, and very juicy. A most handsome fruit for the table.
"I am, Sir, yours truly,
"November 16, 1877.

"C. BILLESON."

From Mr. GEORGE SANDY, Haverholme Priory, Sleaford.

"Dear Sir,—I have grown your Seedling Melon, with several other varieties, the last two seasons, and find it to be of good constitution, a very free setter, fruit of medium size, beautifully netted, handsome in appearance, and of excellent flavour. It ripens its crop off much quicker than many other varieties now in cultivation, which will make it valuable for early and late crops.
"I am, yours truly,
"November, 9, 1877.

"GEORGE SANDY."

SHARPE'S INVINCIBLE.

SHARPE'S INVINCIBLE.

NEW LONG-PODDED BLUE MARROW PEA.

CHARLES SHARPE & CO.

Have much pleasure in sending out for the first time this invaluable new main-crop Pea, which has been raised by Mr. William Culverwell, of Thorpe Perrow, who has devoted a considerable amount of skill and attention to the improvement of this vegetable.

The Invincible is a cross between Veitch's Perfection and Essex Rival, and has the advantage of being but little liable to the attack of mildew.

The plant is about 3 feet in height, of a robust branching habit. The pods are produced in pairs, and occasionally three together, from near the ground to the top of the stem—the rows having the appearance of being clothed with pods from top to bottom. The pods are closely packed with from ten to twelve large Peas, which, when cooked, are of exquisite flavour, and of a beautiful deep green colour.

As a main-crop Pea, either for the Gentleman's Garden or the Market Gardener, CHARLES SHARPE & CO. have no hesitation in saying that the Invincible Pea will be found superior to anything yet sent out.

Price, per Quart, 5s.

Half-pint Packets, free by post, 1s. 6d.

PRICE TO THE TRADE ON APPLICATION:

Odontoglossum crispum.
MR. WILLIAM BULL has received a large importation of the above from one of his collectors, and can offer them by the dozen or 100, and will be happy to show them to any one favouring him with a visit.
 Establishment for New and Rare Plants, King's Road, Chelsea, London, S.W.

Vines—Vines—Vines
J. COWAN, The Vineyard, Garston, near Liverpool, has still on hand several thousands of strong, well ripened VINES. Fruiting Canes, 10s. 6d. to 12s. 6d. each; Planting Canes, 5s. to 7s. 6d. each. Catalogues free. Trade supplied. Terms on application.

FRUIT TREES, extra large, to bear directly.
 —Walnuts, Prune Damsons, large Black; Victoria and other Plums, Mayduke Cherries, new Yorkshire Cockpit Apples, Williams' Don Chretien, Beurre de Capiaumont and Ashton Town Pears; Scarlet and other Filberts. To be sold cheap. Free on rails. Splendid SPRUCE, Scotch FIR, and LARCH. W. JACKSON AND CO., Nurseries, Bedale.

Variagated Hollies, full of Berries.
WILLIAM CUTBUSH AND SON beg to draw special attention to the above, being very fine and fit for Christmas Decorations; fine stuff, from 3 to 5 feet, 5s. to 7s. 6d. each. Trade price on application.
 Highgate Nurseries, N.

American Grown Tuberose Roots.
TUBEROSE ROOTS, of my own growing, finest quality Roots, £s. per 1000.
 EULALIE JAPONICA VARIEGATA, £2 per 100.
 FRANKLENIA PUBESCENS, 2 to 4 feet, 15s. per dozen.
 All packed free; freight by steamer. Baltimore to Liverpool, low. JOHN SAUL, Washington, D.C., U. S. America.

TO THE TRADE.—Christmas Roses, well set with flower-buds; Spiraea japonica, Dielytra spectabilis, Lily of the Valley, in fine clumps for Forcing; Gladiolus brachyelysis and French Hybrids, tuberous-rooted Begonias, Hvacinths, Tulips, Crocus, Narcissus, and other Dutch Bulbs, at low prices.
 F. SANDER AND CO., Seed Growers, St. Albans.

ROSES, Dwarf Hybrid Perpetuals, very strong, of leading sorts, on Manetti Stock; these, being budded so low as to leave scarcely any of the stock, are admirably adapted for pots or beds; 9s. to 12s. per dozen, 70s. per 100.

YUCCA RECURVA, fine specimens, about 2 feet, 3s. 6d. each
PYRACANTHA, Red-berried, hardy plants, 1-yr., in 4-inch pots, 4 to 6 inches, 3s. per dozen, 21s. per 100.
 2-yr. in 5-inch pots, 9s. per dozen.
 H. McMILLAN, St. James' Road Nursery, Kingston-on-Thames.

MYROBALAN, or CHERRY PLUM, is the best stuff for Mending Old Fences or Making New Ones. It grows vigorously in the poorest soils, even where Whitethorn will hardly exist, and bears clipping like Whitethorn. Its stiff hard branches, and dangerous spines or thorns, effectually prevent cattle or evil-disposed persons from getting through Fences made of it. Plant from four to six in a yard. Sizes and prices on application.
 EWING AND COMPANY, The Royal Norfolk Nurseries, Eaton, near Norwich.

KENTISH FRUIT TREES.—One of the largest and cheapest stocks in the county, consisting of tall Standard CHERRIES, Standard, Pyramid, and Espalier APPLES, PEARS, and PLUMS, from 70s. per 100; GOOSE BERRIES, CURRANTS, &c.
 CATALOGUES of 300 varieties, including all the heavy and sure croppers suitable for Market Growers
 T. EVES, Gravesend Nurseries. Established 1810.

To the Trade, &c.
LIMES, large Red-twigg; Giant and other ELMS; HORSE CHESTNUTS, &c.; extra fine, clean, well grown, and well rooted trees, suitable for Street or Avenue Planting, or for Immediate Effect in Parks, &c. Particulars and prices on application.
 EWING AND CO., The Royal Norfolk Nurseries, New-market Road, Eaton, near Norwich.

Fruit-bearing Trees.
FINE STANDARD and PYRAMIDAL PEARS—A large quantity of the above to be sold cheap, the land being required for other purposes. Inspection invited. No reasonable offer refused. All recently removed.
 JOHN STANDISH AND CO., Royal Nurseries, Ascot, Berks.

To the Trade.
AGRICULTURAL and GARDEN SEED.
H. AND F. SHARPE'S WHOLESALE SPECIAL CATALOGUE of HOME-GROWN SEEDS is now ready, and will be forwarded on application. Every variety named in it is of the very finest quality in every respect. The prices are very low.
 Seed Growing Establishment, Wisbech.

THE NURSERIES, Wandsworth Common, Garratt Lane, and Tooting.
 The Nurseries comprise 70 Acres of a remarkably useful and well grown stock of HARDY SHRUBS, FRUIT, FOREST, and ORNAMENTAL TREES, CLIMBING PLANTS, &c., especially adapted for planting near London. A personal inspection earnestly solicited. Catalogues free on application to R. AND G. NEAL, Chief Office, Wandsworth Common.
 The Nurseries are situated one mile from Clapham Junction, on the highroad from Wandsworth to Tooting, and a quarter of a mile from Wandsworth Common Station, London, Brighton, and South Coast Railway.

Queen of Lilies, Lilium auratum.
 As this year's shipments will be shortly arriving from Japan, **WILLIAM GORDON** begs to call attention to the following low prices:—sizes: No. 1, 6d.; No. 2, 1s.; No. 3, 1s. 6d.; No. 4, 2s. each. Sampling orders are supplied only in the following quantities, and are carefully packed in tin boxes to contain only the following number of bulbs, the prices quoted including carriage to any part of the United Kingdom:—2 bulbs, 6d. extra; 4 bulbs, 1s. 6d.; 8 bulbs, 2s.; 12 bulbs, 2s. 6d., added to the foregoing prices. Quantities of 18 bulbs and over package and carriage free, less 10 per cent. discount. LILY LIST on application.

Royal Norfolk Seed Establishment.

READY JANUARY 1,

THE
ILLUSTRATED GUIDE

FOR
AMATEUR GARDENERS,

Spring, 1878.

Containing 116 pages of beautifully illustrated Letterpress, complete Directions for the successful Management of the Kitchen Garden and Flower Garden throughout the year, with Original Articles on the Cultivation of various Flowers and Vegetables, a Select List of Choice Kitchen Garden and Flower Seeds, Lilies, Gladioli, Seed Potatos, &c. Also a superbly finished Coloured Plate, the whole enclosed in a charmingly beautiful Cover of a new and elegant design.

This will be found by far the most splendid and useful Seed Catalogue ever published, and should be read by every one having a Garden.

Price 1s., post-free. Gratis to Customers.

OPINIONS FROM THE PRESS.

"For a long time Messrs. Daniels Brothers have been noted for their exquisite taste in design and colour manifested by their Catalogues, and we have to say of their *Illustrated Guide for Amateur Gardeners* for the present spring, that it is quite up to the high standard which this firm aims at." *The Farmer*.

"This is the most tasteful and best executed thing of the kind we ever remember having seen." *The Country*.

"Profusely illustrated, and the coloured plates are quite beyond the average of book illustrations." *Liverpool Mercury*

 " extra specimens, 4½ to 5½ feet, 7s. 6d. each.
PINUS AUSTRACA, 4 to 5 feet, 6s. to 9s. per dozen.
VEW, English, 2½, 3, 3½, 4, and 4½ feet, 6s., 9s., 12s., and 18s. per dozen.
 " Irish, 4, 5, and 6 feet, 2s., 3s., and 4s. each.
 " ELEGANTISSIMA (Golden), 3, 4, and 5 feet, 3s. 6d., 5s., and 7s. 6d. each.
 " extra specimens, 20s. 6d. each.
 The above have all been recently transplanted and carefully prepared for removal. Small crates packed to travel safely any distance.
WILLIAM BRYANT, The Nursery, Rugby.

NEW AND CHOICE POTATO

OFFERED BY

W. SMITH & SON, ABERDEEN.

GRAMPIAN (Robertson).

A very handsome and singularly distinct early round variety, raised by Mr. Robertson, Sunnyside, Blairs, Aberdeenshire. The tubers are large and flattish, having very shallow eyes, skin pinkish white, flaked, with rich rosy pink round the eyes; flesh pure white, very dry, and floury when boiled, and of excellent quality. It is very early and a most abundant cropper, remarkable for its hardy constitution and vigorous growth, growing well in any soil.

Grampian was to be seen in every prize collection of any importance at the leading competitions of the last two seasons. Price upon application.

SPECIAL NOTICE.

THE

GARDENERS' CHRONICLE

For JANUARY 5, 1878, will contain a

BEAUTIFULLY COLOURED ALMANAC (19 in. by 13 in.),

From an original design by WORTHINGTON G. SMITH.

"We believe this will be by far the best coloured almanac that has ever been given away with any newspaper."

Applications for Advertisement space in this number are requested to be sent in as early as possible.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.

ESTABLISHED SPECIMEN ORCHIDS.

MR. J. C. STEVENS has received instructions from Messrs. JAMES VEITCH & SONS, of Chelsea, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., without reserve, on THURSDAY, December 20, at half-past 12 o'clock precisely, a selection of choice Specimen and other ORCHIDS, which are being sold only in consequence of their houses being so crowded. Amongst the plants will be found strong CATTLEYAS, of sorts; AERIDES FIELDINGI, very strong; A. RUBRUM, rare; CYMBIDIUM EBURNEUM; DENDROBIUMS in variety, including the very fine D. BRYMERIANUM, offered for the first time; the fine new hybrid D. AINSWORTHII; LYCASTE SKINNERI ALBA; established plants of ODONTOGLOSSUM ALEXANDRE and VEXILLARIUM; VANDA CERULEA, MASDEVALLIAS in variety, AERIDES SCHROEDERI and CRASSIFOLIUM; VANDA CATHCARTII, the finest specimen in the country, and many other fine kinds.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

PHALÆNOPSIS SUMATRANA, VANDA LOWI, CYPRIPIEDUM BOXALLI.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, December 20, at half-past 12 o'clock precisely, good plants of the rare and lovely PHALÆNOPSIS SUMATRANA, P. VIOLACEA, VANDA LOWI, upwards of fifty plants in flower or bud of CYPRIPIEDUM BOXALLI, upwards of fifty plants in flower or bud of ODONTOGLOSSUM CIRRHOSUM, PHALÆNOPSIS SCHILLERIANA and P. AMABILIS, fine strong plants, all with flower-spikes; DENDROBIUM WARDIANUM, with flower-buds, and other choice Orchids.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

SURPLUS NURSERY STOCK,
AT GREATLY REDUCED PRICES.

WOOD & INGRAM

Have just issued an abridged LIST of SURPLUS NURSERY STOCK, which will be forwarded free on application.

The Nurseries, Huntingdon, Brampton,
AND ST. NEOTS.

AVENUE TREES.

PLANE TREES.—Several thousands of the true *Platanus occidentalis*, from 10 to 20 feet high, straight stemmed, stout, and splendidly rooted.

LIMES, 10 to 20 feet high.

POPLAR, *canadensis nova*, 12 to 20 feet high.

These Trees have been grown expressly for Street and Avenue Planting.

They are to be seen growing at Knap Hill, and are, without question, the finest stock of their kinds to be found in any Nursery in Europe.

ANTHONY WATERER,
KNAP HILL, WOKING, SURREY.

WELLINGTONIA

gigantea pendula nova.

LITTLE & BALLANTYNE,
CARLISLE,

Were awarded the first prize for "a new Conifer of real merit," at the International Horticultural Exhibition at Carlisle last September, and they are now sending out

Plants from £2 2s. to £5 5s. each.

This Wellingtonia has a perfectly distinct habit from all others, and has been noticed and described in the leading horticultural journals, and advertised by us for some time back. Since we were awarded a prize for our plant others are advertising Weeping Wellingtonias, which are perfectly distinct in habit from ours, the original plant of which may be seen at any time in our Nurseries at Knowefield, and is now 6 feet 6 inches in height, having never altered its character.

LITTLE & BALLANTYNE,

KNOWEFIELD NURSERIES,

CARLISLE.

ROSE BUDS.

All who wish to have a succession of Roses from the open ground, from June to November (without forcing), should plant

QUEEN of BEDDERS (Noble).

See *Gardeners' Chronicle*, May 5. A beautiful bouquet was cut from open ground Nov. 20, 1876. Price is within reach of everybody.

NOTICE TO THE SEED TRADE.

EXTRACT FROM
CARTER'S
LIST OF NOVELTIES
For 1878.

ESCHSCHOLTZIA MANDARIN.

First-class Certificate Royal Horticultural Society.

"ESCHSCHOLTZIA CROCEA MANDARIN.—A distinct variety: the outer side of the petals brilliant scarlet, the inner side rich orange; very brilliant in colour, and most desirable."—*Gardeners' Magazine*, July 7, 1877.

Electros, price 7s.

NEW JAPANESE DIANTHUS,
Eastern Queen and Crimson Belle.

"Messrs. James Carter & Co. exhibited cut blooms of two varieties of Dianthus Heddewigii, named Crimson Belle and Eastern Queen. The size, substance, and richness of the flowers were remarkable. These varieties will be valuable for garden decoration, especially as they have been proved after some years of trial to come quite true from seed."—*Journal of Horticulture*.

Electros, price 7s.

LOBELIA PUMILA MAGNIFICA.

This is by far the finest form of Lobelia in cultivation. The habit of the plant resembles the fine-foliaged pumila variety, whilst the flowers are of immense size, and of the richest ultra-marine blue colour.

We have carefully selected our stock, and it may be depended upon to come perfectly true from seed.

CARTER'S NEW CARMINE
CANDYTUFT.

This splendid novelty is of dwarf compact habit, and the plant presents one mass of vivid carmine bloom. It is most distinct and beautiful—must not be confounded with a flesh-coloured variety lately exhibited by a Continental house.

"CARMINE-FLOWERED CANDYTUFT.—Messrs. Carter & Co. have sent us cut blooms of this Candytuft, which will doubtless be largely grown when better known, its colour being somewhat unusual amongst Candytufts. It is of good habit, and flowers freely in spring and early summer."—*The Gardener* August 18, 1877.

Electros, price 5s.

NEW SWEET PEA—VIOLET QUEEN.

It is dwarfer in habit than the other varieties, and the seed is also quite distinct in appearance, the flowers ranging in colour from deep mauve to light violet, suggestive of the beautiful Bougainvillea.

Electros, price 6s.

For further particulars and other Novelties see above List, just published.

*. * Several Prizes of considerable money value will be offered for some of these Novelties at the Preston and London Shows of the Royal Horticultural Society; for particulars see "Novelty List."

Carter's

THE QUEEN'S SEEDSMEN,
HIGH HOLBORN, LONDON, W.C.

NEW PLANTS.

MR. WILLIAM BULL
IS NOW SENDING OUT:—

HÆMANTHUS RUPESTRIS.

A new species received from my collector in the West Coast of Africa. Its flowers are bright red, freely produced in dense umbels, the latter 3 to 4 inches in diameter, bracted by three to four oblong-lanceolate reflexing leaves, which are about an inch long; the pedicels are from ½ inch to 1 inch in length. A very desirable introduction, seeing that only a few species of this handsome group of Hæmanthi are at present in cultivation.

Price 10s. 6d. each.

CIBOTIUM MENZIESII.

A fine dwarf-stemmed Tree Fern, inhabiting the Sandwich Islands, long since known to botanists, but only recently introduced to our collections in a living state. The trunk is comparatively stout, densely hair-scaly at the crown. The fronds are bipinnate, thick, and coriaceous in texture, glabrous, the pinnae large oblong acuminate, pinnatifid, the segments oblong, blunt, almost entire. The base of the frond-stems is densely furnished with a very dark hair-like covering. Mr. William Bull received a First-Class Certificate for this Fern in 1875 from the Royal Horticultural and Royal Botanic Societies. It is closely allied to *C. pruinatum*, which differs in having the under surface glaucous. *C. Menziesii* is the same plant as that shown at the recent International Exhibition at Carlisle, under the provisional name of *C. nigrescens*. Only imported trunks can be offered.

Price on application.

CIBOTIUM PRUINATUM.

A noble-looking arborescent Fern, from the Sandwich Islands, very nearly allied to *C. Menziesii*, from which it differs in the silvery or glaucous under surface of its fronds. It has stoutish stems furnished at the crown with a covering of hair-like dark coloured scales; the fronds are bipinnate, as in *C. Menziesii*, with comparatively shallow ovate-oblong lobes, but the pinnae and primary pinnules more acuminate; they are smooth on both surfaces: the base of the frond-stems is densely furnished with a dark-brown hair-like covering. This distinct Fern has been awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society. Only imported trunks can be offered.

Price on application.

ANTHURIUM VEITCHII.

An extremely effective and handsome decorative Aroidaceous plant, received by Mr. William Bull from his collector, Mr. Carder, from the United States of Colombia. In the striking character of the leaves principally consists its great beauty; their blades are remarkably long, leathery in texture, and of a bright green; in shape entire, ovate-oblong, and cordate at the base, the two rounded lobes being separated by a funnel-shaped sinus. The young leaves have a glossy metallic hue. The midrib is much thicker near the basal than in the other portions of the leaf; on the upper surface near the base it is rounded, while near the apex it becomes depressed. The spathe is white and oblong; the spadix is scarcely as long as the spathe. This new Aroid has been figured in the *Gardeners' Chronicle*, December, 1876, p. 773, and there fully described by Dr. M. T. Masters, F.R.S., from specimens sent to this country by Mr. Wallis. Fine plants can be offered.

Price on application.

LOMARIA DISCOLOR BIPINNATIFIDA

This beautiful Fern is certainly one of the most handsome of the Lomarias yet introduced. It is of symmetrical habit, its broad sterile fronds rise evenly from the crown, spread outwards in all directions, and arch in an exceedingly graceful manner. Their pinnae are closely set, so that their parts overlap each other, and divided to the mid-rib, the segments being very much toothed and somewhat crisped, which gives the fronds an elegantly fringed appearance. As the plants mature they throw apparently fertile fronds; these, however, in all cases have as yet proved abortive.

This was one of the twelve new plants with which Mr. W. Bull gained the First Prize at the International Horticultural Exhibition held at Dundee in September, 1876.

The specimens offered have been imported from Victoria, and are of various sizes.

Prices on application.

TULIPA STELLATA.

A handsome species, collected and sent from the Himalayas. In colour it appears to be variable, for the collector writes some are white, others are white and pink. The specimens sent with the bulbs are white, with a broad distinct stripe of crimson down the centre of three of the petals; these are lanceolate, slightly concave, obtuse, the three outer larger than the rest, and bright yellow at the base within. It is an attractive and handsome species, and will doubtless be a favourite with those who cultivate hardy bulbous plants.

Price, 5s. each.

NEW PLANTS—(Continued).

ÆCHMEA VEITCHII.

This is a very fine new Bromeliad, discovered and sent me from the United States of Colombia by my collector, Mr. Shuttleworth, in 1874, and again found and sent by my collector Mr. Carder, in 1875. Its flowers are produced in a dense oblong head, each subtended by a squarrose bright scarlet horny-toothed bract, the rich colour of which renders the plant highly attractive. Sepals lanceolate-deltoid, bright scarlet in the lower flowers of the head, white in the upper ones. This new plant has been also sent from the United States of Colombia by Mr. Wallis, and has been described and admirably figured in the November number of the *Botanical Magazine*. Mr. Shuttleworth, however, says that in its native habitat the flower-heads are fully double the size of the one figured, and present a most effective appearance, hence doubtless three collectors being struck with it and sending it home.

Price 1½ guinea each.

PAVONIA WIOITII.

A very remarkable Malvaceous plant. Its flowers are very persistent, freely produced, and borne in subterminal corymbs; the bracteoles are of a lively red, long, narrow, and slightly ciliate; the folded corolla is dark purple, from the mouth of which protrude the stamens, crowned with bright blue anthers. Mr. William Bull has received a quantity of this interesting species from his collector in Brazil, and can offer fine imported plants.

Price on application.

NEPHROLEPIS DUFFII.

This may be regarded as a variety of *Nephrolepis* analogous to the variety of Lady Fern known as *Frizelliae*. The fronds are considerably narrowed, and have a gracefully pendent habit, while the apex is more or less divided in a multifid manner into separate lobes, exactly as occurs in the better forms of the *Frizelliae* type of *Athyrium*. The plant comes from the South Sea Islands, and was collected by, and is named in compliment to, Mr. Duff, the Superintendent of the Sydney Botanic Gardens.

Price 1½ guinea each.

Establishment for New and Rare Plants,
KING'S ROAD, CHELSEA, LONDON, S.W.

MESSRS. CHARLES LEE AND SON,
Royal Vineyard Nursery, Hammersmith, London, W., have much pleasure to offer the following very beautiful and interesting NEW FRUITS, now offered by them for the first time:—

RUSSIAN TRANSPARENT APPLE.—In the *Journal of Horticulture*, December 21, 1876, "J. Lincolshire," describes this valuable Apple as giving a "never-failing crop," and as being "a rent-paying tree" for cottage gardens. Mr. BEULAH, an experienced Lincolshire Orchardist, confirmed this evidence of the usefulness and profitability of this much neglected but desirable Apple. A tree that bears a never-failing crop, of excellent quality, as stated below by Dr. HOGG, must be as near perfection as possible, and a desideratum that cannot fail to be appreciated by Orchardists in general. "The Russian Transparent Apple was brought from Moscow during Napoleon's campaign in Russia, by General Boucheret, who, noticing its hardiness and free growth, and believing it would be suitable for English gardens, brought a quantity of grafts to his home in North Lincolshire, round which it became and has remained up to this time localised; and now, through the kindness of Mr. Beulah, we have been enabled to purchase all the available grafts from the original stock."

The following is from Dr. Hogg's description:—"Fruit large, roundish, somewhat oblate, narrowing towards the crown, where it terminates in several prominent ridges, flat at base; skin smooth and shining, grass green, strewed with large russet dots. Eye closed. Flesh very tender and juicy, with a pleasant sub-acid flavour, and a peculiar and agreeable aroma. I am convinced that this is one of the most valuable culinary Apples in cultivation, and is worthy of more than local fame."

Messrs. Charles Lee & Son have much confidence in introducing this desirable and profitable Apple to more extended cultivation. Strong Maiden Plants now ready, price 7s. 6d. each.

HENSON'S SEEDLING GOOSEBERRY.—This excellent variety was figured in the *Florist and Pomologist* for May, 1874, a First-class Certificate having been awarded to it by the Fruit Committee of the Royal Horticultural Society in 1873. It was described as "a new and distinct variety of exceedingly good quality, of the hairy red section, and a good dessert fruit of medium size."

Messrs. Charles Lee & Son having purchased the entire stock of this valuable Gooseberry, they are now prepared to distribute it to the Public. Price per Plant, 3s. 6d.

The usual discount to the Trade.

Extra Large Trees and Shrubs for Immediate Effect.

WILLIAM IRELAND
begs to offer the following:—
ABIES DOUGLASHI, 7 to 9 feet, 24s. per dozen.
" NIGRA, 4 to 6 feet, 12s. per dozen.
" EXCELSA, 4 to 6 feet, 12s. per dozen.
CÛPRESSUS LAWSONI, 3 to 4 feet, 12s. per dozen; 6 to 8 feet, 24s. per dozen.
CEDRUS DEODARA, 3 to 4 feet, 24s. per dozen.
PINUS EXCELSA, 3 to 4 feet, 12s. per dozen; 4 to 6 feet, 24s. per dozen.
HOLLY, variegated Screw, 2 to 3 feet, 12s. per dozen.
" variegated Hedgerog, 2 to 3 feet, 12s. per dozen.
ARBUTUS UNEDO, very fine and bushy, 3 to 4 feet, 20s. per dozen.
ELMS, of sorts, 10 to 12 feet, 18s. per dozen.
NORWAY MAPLE, 10 to 15 feet, 12s. per dozen.
LABURNUMS, stems, 8 to 9 feet, 12s. per dozen.
All the above have recently been transplanted, and will rise with fine roots.

BEAUTIFUL FLOWERS AND LUSCIOUS FRUIT. WILLS' ELIXIR.

THIS Manure produces the most marvellous and enduring effects on all kinds of Fruits grown under glass, such as Vines, Pines, Peaches, Strawberries, Melons, Cucumbers, and all kinds of Flowering and Foliage Plants. It is equally effective when applied to Fruits and Flowers growing in the open air. It is very light, 1 cwt. being equal to 6 cwt. of any other manure; it is also free from all objectionable smells.

— "Judging by the results seen in the growth of Vines and Strawberries in pots at HECKFIELD, the BUFFALO-HORN MANURE must possess most valuable manurial properties. The Strawberry Plants being limited in root-space, perhaps offer the most forcible illustration of its value, as these in small 24's are most exceptionally robust, the crowns large, and the foliage of a deep green hue. A moderate portion of the Manure mixed with the soil proves to be a singularly valuable constituent." —Vide GARDENERS' CHRONICLE, December 8, 1877.

"Royal Horticultural Gardens,

"Chiswick, August 14, 1877.

"DEAR SIR,—You ask my opinion of the Elixir. I give it you. Early in 1876 Messrs. Taylor & Co., of Clapham, sent a good sample of it here for trial as manure. It has been tried and tested in various ways—in comparison with ordinary stable manure, guano, other patent manures, &c., with the most satisfactory results. We have used it mixed with soil for potting plants, such as Vines, Peaches, Cucumbers, Fuchsias, Pelargoniums, and various others, and as top-dressings in the same manner; also in the formation of a new Vine-border last autumn.

"In each and all cases the deep green hue which the foliage soon assumes, and the great vigour which is imparted, is very striking and notable. Its light fibry component makes it most suitable for mixing with the soil for potting, and when used as top-dressings the roots are soon seen to permeate the entire mass. In the case of the orchard-house trees and Vines so treated the effects are astonishing.

"No manure that we have ever used here has produced results so decided—so apparent and satisfactory.

"I therefore consider the Elixir to be the most efficient of manures, and intend to use it largely.—I am, dear Sir, yours very truly.

"MR. J. WILLS."

"A. F. BARRON."

Cwt., £2 4s.

JOHN WILLS,
ROYAL EXOTIC NURSERY,
ONSLow CRESCENT, SOUTH KENSINGTON,
LONDON, S.W.

SATURDAY, DECEMBER 15, 1877.

FLOWERS AT CHRISTMAS.

NOTWITHSTANDING the prevalence of gloomy days and misty nights, with constant rain and a marked absence of sunshine, the flower producers are hard at work providing the blossoms so much in demand at the Christmas season. Let the weather be what it will flowers will be in demand and must be had, and all that art can do is brought into requisition so that the supply shall not fall short of the requirements of the season.

The method adopted by those whose peculiar business it is to have plants in flower at mid-winter differs materially from what is known as forcing in the ordinary acceptation of the term. There is no trace of that scalding, blinding heat one has to experience in some forcing-houses, a visit to which is a penance rather than a pleasure. The market grower—giving this term a somewhat wide application—does not force so much as he may be said to put a gentle pressure on Nature, and Nature, appearing to be very docile and willing to do its share, then throws into active floral life numberless floral blossoms of varying hues and a multiplicity of forms. Two things strike an observant visitor as he walks through one of the nurseries devoted to the production of flowers—the great variety of subjects grown, and the immense quantities of certain things that appear to be in special demand.

Chrysanthemums are still in force, but that most useful of all the varieties for cutting from, Mrs. George Rundle, is almost or quite done with. Society appears to possess a love for form and outline in flowers, judging by the favour in which this most exquisitely formed of all Chrysanthemums is regarded. If some one could hit upon an expedient by which the flowers of this variety could be had up to the end of February, they would deserve the yet nonexistent order of floral merit.

Double Tuberoses are yet in bloom, but they are sadly feeling the want of solar light and heat to enable them to expand their blossoms. Bottom-heat is of but little advantage in the absence of the genial warmth generated by the sun. The batch of late potted bulbs that are now throwing up their flower-stems are spoilt by the rotting of the half-formed buds. The sun ceases to shine, and the humidity of the atmosphere works ruin.

What a magnificent sight the Poinsettias are in Mr. John Reeves' nursery, at Acton! It is when they are arranged in solid divisions, and can be counted by hundreds—the plants so even in size and appearance as to suggest the fancy that they have been grown according to rule—that one appreciates their great beauty. How dwarf, healthy, and clean the plants; how stout and broad, and how gorgeously coloured the glowing vermilion bracts are? Numbers of these plants are sent to the North of England and Scotland every autumn; and travel (when carefully packed) with but little harm. The Poinsettia is in force from the middle of November till the end of January; and then the double variety, which is later in blooming, carries on the service till March. As a decorative plant the double variety is inferior to the single form; but it possesses one great advantage, it keeps fully three weeks longer in a cut state. The white variety is a little grown,

but its more gorgeous relative completely eclipses it, and, as is only natural, the brilliant hue is most highly esteemed at mid-winter.

Of white flowers that are now in use may be mentioned *Bouvardia jasminiflora* alba, *B. Vreelandii*, *Eucharis amazonica*, Roman Hyacinths, paper-white Narcissus, white Van Thol Tulips, *Gardenia*, small white *Primula*, *Cyclamen*, *Richardia æthiopica*, Lily of the Valley, and *Astilbe barbata*. These by no means exhaust the list, but may be taken as representing the leading flowers.

What a wealth of flowers the *Bouvardias* produce. They are in the peculiar long low span-roofed houses that appear so well adapted for the forcing of plants and growing market stuff; the plants are within easy reach for cleansing, watering, and such other attentions as are required—they are near the glass, and solar and artificial heat are utilised to the fullest, as the waste is minimised to the lowest extent. Visitors and assistants above the middle height appear to be sadly out of place in one of these places. *Bouvardias* are represented by plants cut back in summer, and are now in 48-pots, and blooming freely. On all favourable occasions air is given, and there is just enough warmth in the hot-water pipes to make the atmosphere comfortable. *Eucharis* are receiving a warmer and moister treatment. Roman Hyacinths are constantly being brought on in successional batches, the bulbs put thickly in boxes as soon as imported, and planted out-of-doors under a 6-inch covering of spent Hops and dung. When the shoots are 2 inches or so in height the boxes are removed, put into a little warmth, and up come the snowy spikes directly, far finer in appearance than is usually seen in the Roman Hyacinth. The Paper-white Narciss, the old double Roman, and that fine variety of the *Polyanthus* section, *Gloriosa*, is similarly treated; but four or five bulbs put into a 48-pot, instead of the bulbs being put into boxes. The Paper-white is the first to bloom, and how chaste and highly fragrant it is; then follows the double Roman, with five and six and more large double flowers on a truss; with *Gloriosa* bringing up the rear. What a tremendous force the bulbs appear to attain during the time they are hidden from view under the heavy coating of rich fertilising material, and their blossoms are in great demand.

The pretty early Tulips are a study, and it is curious to see the large flowers peeping through the scarcely developed sheath of leaves. The sorts are the scarlet, rose, and white Van Thols, and the yellow *La Pluie d'Or* or Golden Prince. The common single Van Thol has got scarce and dear, and it is not now so much used as formerly; and the yellow Van Thol comes into the same category.

Where else in England can such a sight of the old double white *Primula* be seen as at Mr. Reeves', at Acton? At the present moment a long span-roofed house contains about 3000 plants, about two-thirds being in 48-pots, representing plants raised from cuttings struck last spring, and the remainder in 32-pots, containing plants a year older. It is impossible any one can look upon this marvellous array of plants now coming into profuse bloom and say the double white *Primula* is a "miffy" subject. A genial and rather dry atmosphere and careful watering at this season of the year, added to care in getting the plants well-established in pots during the summer and keeping the foliage clean at the time of flowering, makes up the sum of successful culture. As for soil Mr. Reeves uses that at hand when a general potting is going on. Some were in loam only, others in a light soil made up of leaf-mould and sand. If a shoot decays at the junction of the stem with the trunk it is taken off and sent away to the propagating house, and by-and-bye return

a vigorous plant. Cuttings are put in at all times when they can be had. Many of the two-year-old plants had eight or nine crowns each. Mr. Reeves has a few plants of the old Double Purple, now very scarce indeed; and the old Double White is preferred to any of the newer varieties.

The *Cyclamen* is a foremost mid-winter flower. It does not require a great degree of heat or a specially moist atmosphere at this season of the year; it requires to be comfortable, and then it produces its leaves in fine character and numerous flowers. The white blossoms are especially in demand just now. *Richardias*, represented by very fine two-year-old plants, are now making a strong growth, and throwing up massive flowers. Generally two-year-old plants throw the finest flowers; afterwards, these come on well for stock plants, and in the spring throw up numerous offsets, which are taken off, put into store boxes, then potted singly in small pots and put out-of-doors for the summer under a coating of manure, and kept drenched with water.

Lilies of the Valley are now in hotbeds, and flowers are coming up rapidly. There is no expenditure of force in the way of producing leaves, and all the strength of the plant is infused into the flower-spike. There is no root production, and those who force Lilies of the Valley do not trouble to keep the roots after they have done flowering, but throw them away. The earliest flowering plants of *Astilbe barbata* are in a strong heat, and while the plants are producing several spikes of flower they are yet of a dwarf growth. This is early for this valuable decorative plant, and the clumps must have been put into the forcing pit as soon as received from the Continent. A small pit is best; a little soil serves to nourish a root—it is more a matter of plenty of moisture.

Echeveria retusa is a fine winter-flowering plant, remarkably free of bloom. Small plants are crowded with spikes of reddish cerise and yellow flowers. It makes a capital window plant for cottagers and others, for like many succulents it is easily managed.

The decorative *Pelargoniums* that flower at this season of the year yet remain to be noticed. The old Crimson Gauntlet is now blooming freely from nice bushy spring-struck plants; its earliness makes it such a great favourite. For a white, *Blanchefleur* or *Russell's Annie* is the earliest; a good grower and very free. The coming white *Pelargonium* is *Duchess of Edinburgh*, with a free-branching distinct habit, and a plentiful crop of trusses of fine well-formed flowers. *Pelargoniums* are having much the same treatment as the *Poinsettias*.

Nor must the homely fragrant *Mignonette* be forgotten. Charmingly flowered plants have been sent to market for some time past, and the supply will go on for successional batches for months to come. The plants are in cold frames, near the glass; and when frost threatens some covering is put on to keep the flowers free from blemish. Some idea of the number of pots used in one of the market nurseries may be imagined, when it is stated that Mr. J. Reeves of Acton uses every year from 15,000 to 20,000 48-pots for the culture of *Mignonette* alone. The yearly account with the pot manufacturer is something prodigious. The 48-sized pot is the one mostly in request; it might be termed the regulation market size. The latest of Mr. Matthews' production is represented by an elegant, lightly made article, combining the maximum of size with the minimum of weight. The homely potter has become a true artist.

This list might be considerably lengthened, but the foregoing suffices to give the leading Christmas flowers. Some persons are apt to suppose that the application of powerful stimulants in the way of manures has much to do with these remarkable market productions. It

is much more a matter of clever culture and constant attention. One of the largest market growers attests that strong manures are not necessary, and that he does not use a quarter of a hundredweight of guano in the year. Liquid cow-manure is that mostly used, and that not very strong. It is applied at the right time, it is applied properly, and with attention. Method, order, regularity, and thoroughness prevail in these market nurseries; the work is rapidly and effectively done, and at the right time. They are admirable schools of horticulture, and every man who aims at making his mark as a practical gardener would find it to be of incalculable advantage to spend a year or two at one of these plant-producing establishments. R. D.

New Garden Plants.

DENDROBIUM LITUIFLORUM FREEMANI, n. var.

The other day I wrote upon *Dendrobium lituiflorum robustius*. I will now direct attention to an older, very curious introduction of Mr. Bull's. It has straight stiff stems, a good deal thinner than those of *robustius*, whether erect or pendent I do not know, but very probably erect. The flowers are nearly those of the well-known, generally grown variety of *D. lituiflorum*, but the lip is covered with denser hairy bodies (small, now branched lamelloid bodies), and there is a yellowish white zone in lieu of a white one. It is, horticulturally speaking, no doubt quite a distinct thing, yet botanically I think it may be ranked as a variety. If I am right, then we have in *Dendrobium lituiflorum* a very astonishing series of variations in the stem, even more astonishing than in *Dendrobium Wardianum*. The flowers fully developed with us must prove exceedingly brilliant, since those which were formed when travelling in the dark cases had charming colours. I have to thank for the sight of masses Mr. W. Bull, at whose wish it is dedicated to its discoverer in Assam, Mr. W. B. Freeman. *H. G. Rehb. f.*

*IRIS (POGONIRIS) KASHMIRIANA, Baker, n. sp.**

For drawing my attention to this fine new species of *Iris*, I am once again indebted to my valued correspondent, Max Leichtlin, Esq. It is a native of Kashmir, and was received by him from the Kew collection, along with a white-flowered variety of *I. ensata*, from the same province. It comes nearest to *I. florentina*, with which it quite agrees in general habit. It differs from *florentina* in its sweet-scented flowers, pure white without any perceptible slaty tinge, with falls veined up to the top of the beard with a brighter yellow, by its large spathe-valves scarious at the tip only at the flowering time, and especially by its stigmas, which are milk-white in colour, two-thirds as long as the segments of the perianth, with much larger conspicuously imbricating crests, which are decurrent for some distance down the part of the blade as a winged keel. In *I. florentina* the stigmas are slaty-white, less than half as long as the perianth-segments, and have small deltoid crests. The present plant flowers along with *germanica* and *florentina* at the end of May.

General habit entirely of *I. florentina* and *germanica*. Leaves ensiform, slightly glaucous, $1\frac{1}{2}$ foot long, 18—21 lines broad when fully developed. Flower-stem 3 feet high, much overtopping the leaves, bearing several clusters of flowers. Spathe-valves oblong, 3 inches long, scarious through about the upper third at the flowering time, bright green in the lower two-thirds, the outer valve 15—18 lines broad. Pedicel very short inside the spathe. Ovary oblong, shallowly 6-sulcate, $\frac{3}{4}$ inch long; tube bright green, $\frac{1}{2}$ —1 inch long; limb 3 inches long, the standards and falls of equal length and breadth (15—18 lines broad), pure white without any slaty tint, the latter cuneately narrowed from near the broadly-rounded tip to the base, falcate in the upper half with a beard $\frac{1}{2}$ inch long of white hairs with a yellow tip, closely veined up to the top of the beard with yellow lines; standards erect, with an orbicular blade 2 inches long, and short distinct claw, veined up to the top of the claw. Stamens $1\frac{1}{2}$ inch long, the anther equalling in length the flattened filament. Stigmas 2 inches long, including the crests, milk-

* *Iris (Pogoniris) kashmiriana*, Baker, n. sp.—Folliis ensiformibus sesquipedalibus glaucescentibus; scapo tripedalibus corimboso florum fasciulis pluribus prædito; spathe valvis oblongis magnis tempore florendi apice solum scariosis, floribus suavisæulentibus albis; pedicellis brevissimis; ovario oblongo 6-sulcato; perianthii tubo subpollicari, limbi tripollicaris segmentis æquilongis et æqualiter extoribus obovato-cuneatis divio superiore falcatis ungue limbo æquilongis barbato flavide striato, interioribus erectis, limbo magno rotundato ungue brevi; stigmatibus bipollicaribus lacteo-albis cristis magnis oblongo-deltoides late imbricatis.

white, the crests oblong-deltoid, $\frac{3}{4}$ inch broad, much imbricated, and running as a wing about halfway down the keel of the face of the blade nearest the centre of the flower. The plant was sent to Kew by Dr. Aitchison, but has not yet flowered with us. *J. G. Baker.*

STONE'S APPLE.

At one of the autumn meetings of the Royal Horticultural Society, Mr. Louis Killick, of Langley, near Maidstone, exhibited a dish of Apples under the above name, which on account of their fine size and handsome form came in for a good deal of notice, and when the same gentleman showed another dish of fruits on October 2, the Fruit Committee consi-

name of Loddington Seedling, and we quote his description:—

"Fruit large, varying from 3 to 3 $\frac{1}{2}$ inches in diameter; roundish, slightly flattened and narrowing abruptly towards the eye; it has obtuse ribs on the sides, which become more distinct towards the eye, where they form ridges round the crown. Skin smooth and shining, grass-green at first, with a brownish cheek; but after being gathered it becomes a fine lemon-yellow, with a pale crimson cheek, marked with broken streaks of dark crimson; the surface is strewn with minute russet points. Eye closed, with convergent leaf-like segments, set in a deep and prominently plaited or ribbed basin. Stalks $\frac{1}{2}$ inch to $\frac{3}{4}$ inch long, slender for the size of the fruit, and inserted in a deep, wide, funnel-shaped cavity, which is lined with pale ashy russet extending over the base of

The risks they run are immense. There is a continual catering to supply pleasure to the pleasure-seeking public. To the Crystal Palace and other companies a horticultural *fête* must form but a very small share of the year's programme of amusement for the general sight-seeing public. And rather should I be inclined to look upon their encouragement to a horticultural show as being more of a condescension on their part to gardeners, in presenting them with an opportunity to show their prodigious productions to the world, than that they should, for all their pains, be rated by a minority of gardeners for the show being of too long duration. The finances of those companies are at stake—they must win an "honest pound" at the gates to enable them to present an honest prize

FIG. 144.—STONE'S APPLE.

dered it well worthy of the award of a First-class Certificate, which it accordingly received. The accompanying illustration (fig. 144) was prepared from a fruit and some foliage kindly sent to us by Mr. McLean, Lord Holmesdale's gardener at Linton Park, whose cottage is situated about 300 yards from the original tree, from which Mr. McLean believes most of the fruit farmers in East Kent have been supplied with grafts. The original tree is situated on a farm at Loddington, once occupied by a Mr. Stone, hence the name of Stone's Apple, and it has been sent out by Messrs. T. Bunyard & Sons, of Maidstone, under the name of Stone's Apple, or Mapson's Seedling, and in their catalogue before us they describe it as "very large and handsome, a sturdy grower, much grown at Linton for market, good bearer," and in use from January to March. In the *Journal of Horticulture* recently Dr. Hogg described the variety under the

the fruit. Flesh very tender, and with a pleasant sub-acid flavour. This is an early culinary Apple of great excellence, coming into use in September."

The Apple as shown at the last meeting of the Royal Horticultural Society was larger than that here illustrated, globose at the base, very slightly tapering towards the eye, almost the shape of a large globose Onion, and quite destitute of any appearance of ribs. The foliage, as will be seen from our illustration, is very characteristic.

FRUIT EXHIBITORS AND THE SITUATION.

THAT the promoters of fruit exhibitions should have an interest in seeing themselves pretty safe in a financial point of view is no more than natural.

to successful exhibitors. It is not at all an uncommon thing for a flower or a fruit show day to be a wet one. On these occasions the goddesses Flora and Pomona are not always smiling; we omit to do as they do in some other countries—offer them festival and even sacrifice for their good graces, so we must be content to take the weather as it comes! Compared with companies or societies the risk of the gardener individually is trivial. To begin with, the fruit he exhibits is not his own, and admitting that it is all honestly grown at home, it belongs to his master; it has been grown entirely at his expense, and if not the travelling expenses, at least the gardener's wages are paid for every day he is out, and at the end of a three days' show, if the fruit by long exposure to dust, or wet, or theft is neither fish, nor flesh, nor good red herring, the loss must still be sustained by the employer, unless he can philosophically console

himself by a belief that the fruit has been utilised as a worthy sacrifice to the goddess of fruit.

It is rather amusing to note the threat of a small knot of exhibitors, that if the present three days' system of showing is continued they will withdraw their exhibits—leaving the sun out of the question, according to their opinion. They must surely indeed fancy themselves as composing nearly the whole of the fruit-growing community in the country. Some of them have deservedly taken many good first prizes, and some of them too, be it also noted, have perhaps taken some firsts made up with a liberal sprinkling of good seconds and thirds, the whole forming together, horticulturally speaking, another famous 600! Granting them, however, all merit for their present position of riding on the top of the great horticultural wave, yet we are taught by Nature to observe how wave succeeds wave, and that those now on the crest will ere long pass on and sink into the abyss of obscurity, to be succeeded by other waves bearing with them other aspirants for similar fame. The present opportunity, however, is theirs, and we must gently blame them for whistling up their name by a united threat to withdraw. All this is human nature.

It is sincerely to be hoped, for the sake of gardening generally, and especially for those of our successors (added to that, our paternal duty, that we should leave the field better prepared for them than we found it) who may have, like ourselves, emulous desires to win their horticultural spurs, by following in our wake with their fruit on the exhibition tables of the Crystal Palace, the Royal, or the Botanic, that these companies shall not take offence at the impertunate solicitations of the noisy few, and so create a dead-lock—put a stop to fruit shows being held at any of these great metropolitan horticultural centres. After all, it is a delicate question with many of our employers whether they are justified in allowing their gardeners to hawk their fruit from one show to another about the country, opening up the temptation to show fruit for no other purpose than that of making money; and hence it is often understood, on the other hand, that certain employers encourage their gardeners to do so, and look upon prize-money as being equivalent to wages. This betrays the existence amongst the ranks of both classes of a very unhealthy state of affairs, the tendency of which is to sink gardeners, gardening, and horticultural exhibitions to a very low ebb of morality. Hence the busily whispered remark about the demoralised state into which our horticultural shows have fallen. Whether these productions have been over-paraded about the country is a matter of opinion. My own opinion is that they have, and that those who do so are, to a greater extent than we are aware of, unconsciously lending themselves to bringing about a state of affairs to be found only amongst that kind of society who follow the turf and other similar questionable pursuits for a living.

We have been quite long enough accustomed to the yearly monotony of fruit and flower shows, with their degrading proclivities, and it is quite time some fresh manoeuvre should be introduced for the benefit of our calling—to a profession we dare not assume—which would entirely change the position of the whole of our horticultural front. Supposing, then, that by some dexterous movement we could manage to change fronts with our employers, so that they would be put exactly in our vacated position as competitors for prizes—not for a few paltry shillings, certificates, or bronze medals, which the humility of our position allows great societies to offer us without a blush—but some substantial form of prize which it would be both honourable and creditable for them to fight for. If some philanthropic individual could not be found forthcoming to take it up, there is plenty of money in the country, and I would propose to raise sufficient and so create a fund which would yield annually several handsome prizes to induce proprietors to compete. The nature of the object to be competed for might be for the best laid out, planted and kept pleasure ground, extended perhaps [to the kitchen garden, hothouses, &c.]. Some years the prizes might be offered for the best laid out park, containing both wood and water. Other years again the prizes might go for the best managed plantations, hedges, drives, &c. Of course proprietors and places would have to be classed, districts formed, &c., all details of which to be managed and worked out by a well appointed committee, working from a general centre of management, similar to that of the Royal Agricultural Society of England—in fact a leaf out of their book would be

invaluable to float our organisation. The gauntlet being by this move thrown down to proprietors themselves, they would become directly interested, which before they have not been. After a period of long inaction, landscape gardening, arboriculture, and horticulture would receive new life, an immense and we might venture to say instantaneous impulse would be given to all horticultural energies, intellectual and industrial. Many additional acres would be enclosed, more hands kept, rare trees and shrubs planted, a demand for a better paid and more intelligent class of gardener and forester; in fact, speaking in military parlance, a general advance would be made along the whole line. Ladies too would be enlisted, and instead of spending all their spare time as they do now, either croqueting, rickering or playing lawn tennis, they would study, join and make a grand accession to "the noble army of gardeners." I am not quite sure but that a movement of this kind, well-worked out, would not go further, and so gain in favour as to put gardening in a fair way of being uplifted to the rank of a profession, established perhaps and endowed.

I place my suggestions in the hands of the public, or if advisable in the hands of the Royal Horticultural of London to work out, if they can be trusted with the working of it out and keeping it together. We all know what a muddle they have made of their own affairs, what sums of money they have so foolishly and so irrecoverably spent over a smoky town square; and instead of bestirring themselves to make amends for bygone mistakes, how they are still sitting down twirling their thumbs, and crying over spilt milk. Once I gave them an idea, which they seized with the greatest avidity and for a time they worked it out well. It was indeed the only thing the horticultural ship of these later days did, to give the shore any pretence to the office, but by sheer mismanagement they were soon again on the lee shore, bumping and floundering on the rocks: but what other could be expected? The idea was a plagiarised one; they never thanked me for my idea, neither did they condescend to ask my leave to carry it out—I was never asked to be a censor at any of those great meetings. They were then throwing their honorary fellowships about; none ever reached me, so I have nothing to thank them for. What I am alluding to was the idea of bringing the Royal Horticultural Society's shows to the provinces. It had long been on my mind, when at last an opportunity occurred when Mr. (now Sir Henry) Cole of the South Kensington Museum was in this neighbourhood on a picture-hunting expedition. I gave it to him. I do not grieve personally because an honorary fellowship was not conferred upon me, but I take the opportunity of doing so on behalf of gardeners generally, and feel that as a class we are very much neglected. I feel that I am setting forth the case of many who, like myself, have gone to places and spent whole lives in the making and planting of them, and in the end there is no hand of recognition or fellowship held out to us, and were it not for the kindly encouragement and acknowledgment given to our exertions by the private enterprise of the horticultural press, we might die in the last ditch unnoticed, uncared for, unburied, for anything the Royal Horticultural Society of London cares to the contrary. To Thomas Edward, the Scotch naturalist, the hand of fellowship could be held out by the Linnean and other societies, but to the plodding, persevering gardener there is no reward. We have no organisation amongst ourselves—no guild; and it is often by the merest accident that even good men, after spending years about the country in search of knowledge and experience, obtain situations worthy of their pains. What really is wanted is some move towards the elevation and improvement of the gardener's position, practically and morally, so as to enable him to win the "honest pound" at home without having recourse to hawking through the country for it. *William Miller, Combe Abbey Gardens.*

DR. PATERSON'S ORCHIDS.

HAVING had the pleasure on the 1st inst. of inspecting the excellent and interesting collection of Orchids grown by Dr. Paterson, at Fernfield, Bridge of Allan, a few remarks upon those in flower at this dull season, and the admirable way in which the collection is grown, may be of some interest. A grand plant of *Cattleya Leopoldii* was in full bloom, each spike averaging about a dozen richly coloured flowers, and although a common species in most collections it is very effective at this season when so well done as this specimen is. A remarkably healthy plant of *Vanda cœrulea* was bearing a fine spike of eleven of its beautiful pale-blue flowers, of a larger size and greater substance than is usually met with.

So healthy a plant, without the slightest symptom of "spot" or canker, is seldom seen, and Dr. Paterson attributes his success in cultivating it to hanging it up near to a roof ventilator, where it has plenty of light with an airy breeze blowing about it for at least nine months of the year, the plant only being taken down and set on the stage while it is coming into flower and flowering. When done flowering it is immediately hung up in its airy position, where it makes fine sturdy growth, perfectly free from any spot or blemish. A large plant, in luxuriant health, of a fine and distinct variety of *Vanda tricolor* had several closely flowered spikes, of well shaped, clear and richly marked flowers. This is the only plant of its kind said to be in the country, having been imported by Dr. Paterson from the East Indies. *Miltonia Moreliana atrobura* was nearly over, but had been finely in flower for some weeks, and the few fresh flowers left showed a size and depth of colour indicating perfect health and successful culture. A grand plant of *Lælia superbiens* was bearing several tall spikes of its handsome flowers; as were also smaller plants of the useful and lovely *L. autumnalis superba*, and *L. Perrinii*. Several fine plants of *Lycaste Skinneri* were examples of the best cultivation, with numerous immense flowers of great substance, in some instances two flowers being produced on one footstalk. A large and very fine plant of *Lycaste lanipes* was flowering most profusely, but it cannot be compared to *Skinneri* either for beauty or usefulness.

Oncidium orthorhynchum had two beautiful spikes, and nice plants of *Oncidium Rogersii* were making a fine display. The pretty flowered *Mesospidium sanguineum* had two well flowered and fine spikes upon a nicely grown plant in a 6-inch pot. *Odontoglossum Alexandræ*, *Roelzii*, *Rossii majus*, and *vexillarium*, small but very healthy plants, were producing freely their rich and charming flowers. *O. O. nebulosum*, *cordatum*, *hictioniense*, *Uro-Skinneri*, and *grande* there were splendid specimens with a profusion of flowers. A fine healthy plant of *Angraecum sesquipedale*, about a foot high, was producing a strong spike with four flowers. *Pleiones*, in pans a foot in diameter, and well raised in the centre, were a complete sheet of lovely blossom, the sorts being *P. maculata*, *præcox*, *lagenaria*, and *Wallichii*. A large panful of *Neottia picta maculata* was in splendid condition, and producing some very strong spikes of flowers. *Epidendrum rhizophorum* is a great favourite here, as it produces its scarlet *lxora*-like flowers throughout the whole year. The plant is a large and well-grown one, and the sort is well worth the attention of those who grow Orchids for furnishing cut flowers. Many other species were in fine flower, such as *Masdevallia Harryana*, *ignea*, and *Veitchiana*, *Zygotum Mackayi* and *cristatum*, *Calanthe vestita oculata* and *Veitchii*, very fine, &c.; and of the many fine specimens not in flower all displayed the same fine healthy, stocky luxuriance, a sure sign that they will flower profusely at their proper seasons.

The collection is grown in four moderate-sized and very ordinary looking houses, entered by a door at one end, passing from the cool house next the door through two intermediate ones to the warmest at the farther end, where grow the *Vandas*, *Aerides*, *Saccolabiums*, *Phalaenopsis*, &c.; and the famous plant of the best variety of *Anthurium Scherzerianum*, which is now making a splendid growth, and promises to flower finer than ever during the ensuing season. At all times, except in the severest weather, the doors of the houses are kept wide open, so as to allow a free circulation of air through them and amongst the plants; and as the roofs are certainly not particularly air-tight the breeze is sometimes considerable, but which, with judicious care in all other matters tending to the welfare of the plants, produces that healthy, firm, and well-matured growth which is so marked a feature in the collection. The Doctor, who is a most enthusiastic orchidist, puts great importance upon the roots as well as the tops of his plants being in a proper medium, and takes great interest in selecting the best materials for growing them in, mixing the whole himself, so that each may be in due proportion, and afterwards potting, &c., his plants with his own hands; the only "gardener" employed in the "houses" being an active, intelligent woman who waters, airs, fires, and performs all the necessary routine work in a prompt, careful, and orderly manner, such as might be copied with advantage by many "gardeners" of the sterner sex. Everything clean, sweet, and tidy, with not an insect to be seen,

reflects most creditably on her careful and attentive management.

High temperatures are not in favour with Dr. Paterson. He believes they unduly excite and quickly exhaust the plants; and his practice is: moderate temperatures, a fresh airy atmosphere, more or less moist according to the state of the plants and the season of the year; a due season of rest, and plenty of water to a plant when it is making growth; with sound peat and sphagnum for the roots to grow in, to which he adds a dash of dry pulverised sheep-droppings while mixing it on the potting-bench, the beneficial effects of which are clearly apparent in the robust growths made in such compost. *D.*

PINKHILL, EDINBURGH.

A VISIT to Messrs. Downie & Laird's nurseries at Pinkhill is at all times interesting and instructive, but is doubly so when one is fortunate enough to be conducted over this establishment by the veteran florist and enthusiastic proprietor, Mr. Downie. Our first visit was in 1856, shortly after it had been formed into a nursery, and even to this day the writer has not forgotten the deep impression made upon him by the superior cultivation of Dahlias, Hollyhocks, and other florists' flowers. That there has been no retrogression, but a determination to be still in the foremost rank of floriculture, was abundantly proved when again paying it a visit in the month of March last, and again during the past autumn. Without digressing, it is worthy of remark, to show the esteem in which valuable and tried servants are held by this firm, to state that at our first visit as well as our last we found George Goodall, the indefatigable propagator, after twenty-three years' service in the firm, as enthusiastic as ever. My object in writing this article is to give to others, who have not had the opportunity of paying this place a visit, general and trustworthy statements of the characters of a few of the newest and best varieties of florists' flowers, such as Pentstemons, Phloxes, Pansies, &c., such as appeared to be specially worthy of commendation.

Pentstemons.—The effect produced by the brilliant and abundant display of blooms of this popular florist's flower was incomparably grand—not what is generally seen by a few dozen plants grown together, for they are here by thousands, while a happy thought seems to have struck the planter to arrange near together such as had markings approaching to each other, thus giving an opportunity of testing their differences. Among seedlings selected for distribution we found the following very superior, having flowers more like *Gloxinias* than *Pentstemons*:—Mrs. Fox Terror, deep rosy purple; John F. Kinghorn, very light rosy purple; Archibald Fowler, light rosy crimson; Andrew Hunter, rosy salmon; Perfection, bright rose, pure white throat; William Kelway, dark purple-crimson throat, veined and clouded with bright crimson; Countess of Eglinton, light rosy pink; G. Mitchell, ruby-crimson. Amongst the older varieties the following are worthy of extensive cultivation:—Dr. Masters, Lennie Barron, Mrs. A. F. Barron, Octoroon, Percy Wynne, and William Fowler.

Phloxes.—The dull and damp season of 1877 was propitious in affording an opportunity of inspecting the seedling *Phloxes* of the early flowering section, and here a great advance has been obtained. Amongst those selected for distribution, the remarkably large size of flowers and spikes in the following were conspicuous, viz.:—Lady Musgrave, pure white, form of flower perfection, and exceedingly fragrant; Mauve Queen (a new type), slate colour, flowers larger than a crown piece, highly desirable variety; Archibald Fowler, white with pink rosy eye, very fine. Amongst the old varieties the following are very desirable:—A. McKeith, Beauty, Mrs. Hunter, The Shah, Duchess Dowager of Athole, Luna, Forward.

In the late flowering section we observed a decided advance on existing varieties. The following are very superior both in form and spike:—Earl of Mar, bright rosy scarlet, quite a gem; W. Gorrie, dark, shaded rosy lilac; Alexander Shearer, very bright rosy salmon; Vesuvius, bright crimson-scarlet; Lady H. Boswell, light rosy crimson. Amongst the older varieties I made the following selection as being well worth growing:—Countess of Minto, white, with crimson eye; John Anderson, bright crimson scarlet, with large and finely formed flowers; Miss F. J. Hope, pure white, small rosy pink eye, a most

desirable variety; Thomas Peacock, rosy lilac; Lochair, light scarlet; J. K. Lord, salmon-red; Mrs. Aberdeen, light rosy crimson.

Pansies.—It is well known to florists that for upwards of a quarter of a century the firm of Downie & Laird have been the pioneers in producing and bringing to perfection the whole of the varieties of the *Pansy* tribe: one would now almost be tempted to proffer them the advice of "Rest and be thankful," but judging from the forms they possess of the above in all ages and stages of life the end is not likely to be just yet. As a proof of the severe test this tribe undergoes in selecting for improved varieties it may be stated that Mr. Downie recently discarded thirty out of fifty named varieties of *Violas* which had been bedded out to prove their adaptation for decorative purposes. This firm's motto seems to be, and rightly too, "Selection before collection." Being favoured with a long digest on this tribe the following sorts may be accepted as being likely to prove serviceable for a long time to come:—Mr. H. Pease, pure white, immense bloomer, a true *Viola*, a perfect gem; Fore-runner, purplish-crimson, fine habit, immense bloomer; Crimson Gem, nearest approach to scarlet in a *Viola*, very fine; Crown Jewel (Dæan), pale yellow, immense bloomer; Duchess of Sutherland, blush-mauve and white, a distinct and grand variety; Goldfinder, a pure golden-yellow *Viola*, and most profuse bloomer; Max Kolb, dark purplish-maroon, a very free bloomer; Profusion, pure white, profuse bloomer, has a dash of the *Pansy* in it, blooms six weeks earlier than any other variety, will be much sought after when better known for market purposes.

Another grand feature at Pinkhill, and the last I shall attempt to describe in this paper, is the seedling *Fancy Pansies*, their number being legion, while year by year improvements are effected which have almost, I may say, brought them to perfection in form, rendering them more and more attractive. The varieties selected during the past summer for distribution are not very numerous, but certainly they will be found distinct and a great improvement on existing varieties. The best of them are Mrs. E. Wood, William Postlethwaite, Mrs. Jamieson, of which I give the description in Mr. Downie's own words—"Can anything be finer in a fancy yellow *Pansy*?" Mrs. Plummer, bronze and yellow, the size and markings being something extraordinary; Muna, pure white, grand flower; John Beveridge, bronze and lilac, shaded with blue.

Before leaving, Mr. Downie, anxious that all should be seen, drew my attention to the nucleus of a new arrangement of hardy herbaceous plants, and as nothing is done here by halves ere long a collection will be formed sufficient to meet the increasing demand for this class of long neglected favourites. I have still a few more notes untouched, which I will send you at some future time. *G. Croucher, Ochiltryre.*

LINUM TRIGYNUM.

In your very interesting notice of plants in flower at Kew I was surprised to find that *Linum trigynum* appears to be there treated as a stove plant, as in such a temperature it is always a prey to red-spider, and the blooms soon tumble from the plants when they are in more heat than is generally kept up in a warm greenhouse. Here we depend very much on them for conservatory decoration during the winter in combination with *Salvias*, *Sericographis*, &c., and I find they do far better in a temperature of from 50° to 55° than when it is either higher or lower. With that degree of warmth, and a moderately dry atmosphere just to keep the flowers from damping, they succeed admirably and last in full beauty for months. So valuable are they at and after this season that I would advise all who wish to make a good display to grow a batch of them, as more useful decorative subjects cannot be had, and if shown in contrast with the scarlet bracts of *Poinsettias* or either of the plants mentioned above, the effect is greatly heightened, although the association of the two colours may not be quite correct or in accordance with some tastes.

To do *Linum trigynum* really well they require a pit or frame to themselves, and when either of these can be spared their management is a very simple affair. The way we treat them here is to give them a slight rest after blooming by keeping a little dry at the roots, but during the time this is done the syringe is kept plied freely overhead, without using enough

water to soak into the soil. This constant damping of the foliage is the only way to keep down red-spider, as from some cause or other they appear to have a special liking for this *Linum*, and once they effect a footing it is a difficult matter to eradicate them or prevent their spreading further. By the end of April or May the plants are on the move again, when the shoots are shortened back, and as soon as they break again a portion is used for propagating from, and the others shook out to be potted and grown on for large specimens so as to have two sizes, the oldest of which are annually discarded, and the young ones kept to supply their places. The cuttings taken off with a heel root freely in any close moist atmosphere or under a bell-glass, and are soon fit for potting off, which should be done principally in thoroughly decomposed leaf-soil, or fibry peat, as they are particularly fond of vegetable matter, and like a free, loose medium for their roots to ramble in, and such as water will percolate quickly through. To aid in this the potting should be light, and effected with only a gentle pressure of the soil, which should be rather dry than otherwise, as then it never binds so closely together. For the shook-out plants, about a fourth part of good turfy loam may be added to the peat or leaf-mould, and a fair sprinkling of sand so as to keep the whole open and porous.

The potting complete, the plants should be stood where they can enjoy a temperature ranging from 50° to 60° with a humid atmosphere, such as a forcing-house affords, in which they will soon get hold of the soil and start freely into growth. In June the weather will be warm enough for them to be transferred to their summer quarters—a deep pit or frame, in the bottom of which some leaves, loam, or cocoa-nut fibre should be placed. This will answer the double purpose of plunging them in, to keep the roots in a uniformly moist condition, and the air about them surcharged too, both of which are matters of the greatest importance to their welfare. During sunny days they will require slight shade such as a piece of tiffany or anything of that kind affords, and every afternoon should be closed between 3 to 4 o'clock after being heavily syringed, in doing which it is necessary to drive the water well in under the foliage, as that is the part the spider generally attacks. If this syringing is persevered in every night and morning, they will be entirely free from insects, and such plants as will delight the heart of any one in their healthy appearance, and the floriferous display they make in return for the attention bestowed. Towards the end of October, when the nights are beginning to get cold, they should be removed to where they can get a little more warmth till they show bloom, and are ready for the conservatory or greenhouse, to either of which they may then be removed.

Unfortunately, the *Linum trigynum* is not of much value for cutting, as the flowers soon fall off; but possibly a little gum dropped down the tube, and coated on around the base at the outside, would prevent this, which, if it did, it is a colour and form that would tell well amongst others. *J. Sheppard.*

STRAWBERRIES ALL THE YEAR ROUND.

To have ripe Strawberries all the year round is no longer a matter of conjecture but of fact. We can remember the time when a gathering of four ounces of Black Prince some time in February was considered almost a feat, now we can afford to discard that variety for another that is better in every respect and one that is well adapted for fruiting all the year round, viz., Vicomtesse Hélicart de Thury, a variety that seems to enjoy the questionable honour of many aliases. Whether it is profitable to call one variety of fruit by three or four names I know not, but I have more than a suspicion that the lists of Strawberries might be materially reduced by a fair comparison of so-called varieties.

The autumn and winter supply of fruits will of course depend in a great measure on what quantity is forced the spring previous, it should also be understood that reasonable means and facilities should be given to any one who is supposed to supply fruit in even moderate quantities through the autumn and winter. Judging by analogy the autumn and spring crops are very nearly balanced in point of merit up to November, after that time they are a nominal crop. We can have Strawberries in November quite as good as any Black Prince that ever was gathered in

February, October produce will compare with March September with April, and so on. There is therefore no reason why the Strawberry season should not be extended up to November or continued all the year through.

In every garden where the Strawberry is forced in spring there is material left for the following autumn and winter. Many of the earliest forced plants perish from cold and neglect or are thrown to the rubbish-heap as if they were so many weeds. True, a portion may be saved as the season advances, and planted out either with a view to having a few fruit during the autumn, or for general purposes the following year, and a more excellent plan cannot be adopted for an all-round crop. I think, upon the whole, the preservation of all forced plants is entitled to more consideration for one or other of three purposes, or for all combined. They may be either planted out in the open garden for fruiting a second time, or in cool brick pits where the crop might be protected from heavy rains during the autumn, or brought on later in the season in the Strawberry or other forcing-house. Plants that are turned out of warm houses in March become useless unless they are afforded the protection of a close pit or frame, and naturally brought back to their original hardy state. These plants should be planted out on a rich sunny border, and if elevated so much the better. In planting we assume the balls to be in a fit state to be partially shaken out, and the ground in a suitable state to admit of its being trodden round the ball, leaving all of equable firmness. Where late varieties of Strawberries, such as Eleanor and Elton Pine, continue to do well, the flower-spikes that are pushed up from the forced plant may be nipped off as they make their appearance, but this must be discontinued in time to secure a succession with, say, a week or ten days' blank between. We gardeners should never forget that the greatest dainty may become too common, so that a blank now and then rather enhances the estimation in which such things are held. A second lot should, if space can be spared, be similarly planted out in pits with the lights thrown off. These come in admirably during the latter part of September and October, and can be protected from rough weather, wasps, birds, and other enemies, and there will be no harm in having two strings to one's bow in the shape of a reserve coming on indoors.

The treatment of pot plants is simple enough providing there is adequate labour. If a portion of the early forced plants which were fruited in 5 and 6-inch pots are retained for winter fruiting they had better be partially shaken out after the throng of forcing is over and shifted in 7-inch pots. Those that already occupy this size will only require to have their drainage seen to with an additional top-dressing of horse-droppings or the remnant of an old Mushroom-bed in a workable state. The whole should then be taken to some shady position behind a north or west wall, where they will make fresh roots *ad libitum* through the summer. This position will minimize labour and promote a healthy second growth. The same attention in watering that is given to other plants in another stage of preparation must also be accorded to these, and a dew overhead once a day from a fine rose will also be beneficial after hot days. It may not be considered superfluous to remark that a well-grown Strawberry plant is always conspicuous by the size of its crown and the state of its roots rather than by the number of its leaves, so that in selecting a shady position to save labour and encourage a fresh supply of roots such conditions must be avoided as are known to be detrimental to fruitfulness.

After the second rooting process has exhausted itself flower-spikes will begin to make their appearance, and their removal will, of course, depend on the supply that is coming on elsewhere. It is well to be careful in securing a good crop before the season advances too far, as the process of ripening is so irregular that fruit may be gathered from the same plants for a period extending over several weeks. This is one advantage of winter Strawberry growing, and though we cannot say much of their flavour in December, yet they are, indeed, a rarity, and deserve a place with other dainties on the table in honour of old Father Christmas.

I herewith send you a sample, the produce of one pot, from which stray ripe fruit have been gathered more than once. The sample is neither better nor worse than others in the same house, *W. Hinds, Otterpool.*

THE GENUS AGAVE.

(Continued from p. 717.)

SERIES II.—CARNOSO-CORIACEÆ.—Texture more fleshy and pliable than in the Coriaceo-carnosæ. End-spine not pungent. Teeth never large.

Group IX. SERRULATÆ.—Edge of the leaf minutely serrulate.

91. *A. pruinosa*, Lemaire; Jacobi, Monogr., 168; *A. Debaryana*, Jacobi, Nachtrage, i., p. 49; *A. Kellocki*, Jacobi, Nachtrage, i., p. 50; *A. Gheisbreghtii*, and *dentata*, Hort.—Stem short, 3–4 inches in diameter. Leaves 10–20 in a dense rosette, spreading, oblanceolate-oblong, 1½–2 feet long, 4–5 inches broad above the middle, narrowed to 2 inches above the base, where it is 1 inch thick, the face flat, the centre ½ inch thick, the texture soft and fleshy, the colour a pale glaucous-green, the end-spine very weak, the edge furnished with minute irregular spreading deltoid serrations not more than ¼ line long. Inflorescence unknown.

A native of Mexico, introduced by De Smet, of Ghent, in 1863. It is a very distinct plant, in habit resembling only *A. attenuata*, from which it differs by its serrulate margin. My description is taken from a fine specimen now in the Kew collection, and it is included in Mr. Saunders' series of photographs.

Group X. ATENUATÆ.—Margin of the leaf quite entire.

92. *A. (Littæa) attenuata*, Salm-Dyck, Hort. Dyck., p. 303; Jacobi, Monogr., pp. 176, 261; Revue Hort., 1875, p. 149, tab. 31–32; *A. glaucescens*, Hook. in Bot. Mag., t. 5333; Jacobi, Monogr., p. 139.—Stem reaching a height of 4–5 feet and a thickness of 3–4 inches. Leaves 10–20 in a dense rosette at the top of the stem, oblong-spathulate, 2–2½ feet long, 8–9 inches broad two-thirds of the way up, narrowed to 2½–3 inches above the base, persistently glaucous, one of the most fleshy of all in texture, the face flat when mature, rather concave when young, the base 1 inch, the centre two lines thick, the tip not at all pungent, the edge pale and quite entire. Barren part of the scape twice as long as the leaves, with copious adpressed lanceolate leaf-bracts. Flowers in a dense spike 6–8 feet long and ½ foot in diameter; bracts overtopping the perianth, lanceolate from a dilated base; pedicels ¼–½ inch long. Perianth 2 inches long, including the narrow oblong ¾-inch ovary; segments greenish-yellow, oblong, longer than the funnel-shaped tube. Filaments under 2 inches long; anthers ¾–¾ inch. Style reaching finally to the top of the filaments.

A most distinct plant, introduced from Mexico about 1834, and now spread in all our collections. A full account of it will be found in the *Botanical Magazine*, as cited, from a plant that flowered in the Kew collection in the autumn of 1861. Jacobi describes two varieties, *brevifolia* and *compacta*. Signor Fenzi has sent me a fine photograph of a plant from his collection, taken at Florence in October, 1876, and asks whether *A. spectabilis*, recently introduced by Roetz, which I have not seen, and do not find described, should not be referred here. The species is commonly grown in England under the name of *glaucescens*, but *attenuata* has twenty-seven years priority.

93. *A. (Littæa) Ellemeetiana*, Jacobi, Monogr., p. 178 and 313; Baker, in Saund. Ref. Bot., t. 163; tab. nostr. (fig. 145).—Acaulescent. Leaves 20–25 to a rosette, oblanceolate-oblong, 1½–2 feet long, 4–6 inches broad at the middle, narrowed to 3–4 inches above the base, where it is 1 inch thick, slightly glaucous, the face flat above the middle, the end-spine not pungent, the margin pale and quite entire. Scape, including the spike, 12–13 feet high, stiffly erect, the lower 3–4 feet barren, with squarrose lanceolate bracts. Flowers in a dense spike 8–9 feet long, 7–8 inches in diameter when expanded; bracts linear from a deltoid base, reaching to the top of the perianth; pedicels ¼ inch long. Perianth, including the ½ inch narrow-oblong ovary, 1¼–1½ inch long; tube scarcely any; segments oblong, yellowish-green, ¾–¾ inch long. Filaments inserted at the throat of the tube, 1¼–2 inches long; anthers ½ inch. Style finally overtopping the anthers.

A native of Mexico, introduced about 1864, and named in compliment to Mons. de Jonge Van Ellemeet, of Overduin, in Zealand, the companion and biographer of General Von Jacobi, and whose collection of Agaves, once so remarkable, has, we believe, been dispersed comparatively recently. It was flowered in 1867 by Mr. Saunders, whose rich collection, like that of M. Ellemeet, has also been dispersed, and a coloured figure appeared in the *Refugeum*. It is now widely spread in collections, and was flowered at Kew in 1874, and again in 1877. It is a most distinct and unmistakable species. *J. G. Baker.*

Florists' Flowers.

JOTTINGS FROM MY NOTE-BOOK: SOME GOOD CARNATIONS AND PICOTEE. —Florists are proverbially garrulous—they never tire of talking over the beauties of their favourites; and having a spare hour, it has just occurred to me to write out some notes I made of three of the four exhibitions of the National Carnation and Picotee Society whereat it was my privilege to be present.

The first exhibition, as your columns have recorded, was held in the Aquarium, Westminster, on July 18 and 19, and was, to us Northerners, especially interesting, not only as indicative of a revived and extended taste for these flowers in the South, but also from the mode in which the schedule of prizes proposed, to quote the words of the promoters of the show, to "illustrate the characteristics of the Carnation." Mr. Dodwell had done many bold things during his long residence and leadership in the North, but he never did a bolder thing, from the florist's point of view, than when he proposed to award prizes in the Carnation to "sports, selfs, and fancies." Considering that from the point of view referred to—the florists'—the variegation of the Carnation is a chief and essential property, so much so that a single petal without any colour, or without any white, would ensure the condemnation not only of the flower so circumstanced but all others associated therewith, I shall not be thought extreme when I say, it was a bold thing to do; but when simply recording the fact I go further, and say not only was the innovation not expected to, but was cordially accepted by florists, I think I shall be entitled to assert that florists are capable of recognising beauty wherever found, and are far from being bound by the red-tape of narrow-mindedness too frequently imputed to them.

Of these "selfs, sports, and fancies" at the Aquarium I may here remark that whilst the "sports" from the fine florists' varieties were in all cases markedly superior to the fancies in colour, smoothness, substance, and size, yet in the declension from their high estate of variegation they had not suffered unalleviated degradation, inasmuch as the fragrance, which is, though not unknown, a rare property in the richly marked Carnation, had been returned to them in so liberal a measure that the table on which they were displayed was delicious as a bank of Violets.

The exhibition as a whole suffered from the late and untoward character of the season, many of the flowers other than those from Mr. Turner and Mr. Douglas lacking the completeness of fully developed growth, yet, nevertheless, it was fine, and I never remember to have seen finer specimens than those in the open class from the gentlemen named. Mr. Douglas' Picotees, indeed, were perfection.

Of the management too high praise cannot be accorded. So excellent was the organisation that the work of judging quite one thousand specimens, besides plants in pots, and the affixing prize-cards, &c., was performed within an hour; everything being ready for the earliest arrivals to the private view. On one point, however, I would urge upon the executive a reform, which needs but to be seen to be appreciated—the enforcement upon exhibitors of stands of uniform dimensions. This is not a large matter, but it greatly mars or makes the effectiveness of a show.

But to my notes, which, to avoid repetition, I classify. In Carnations, scarlet bizarres, Admiral Curzon, Dreadnought, Mars, Mercury, Sir Joseph Paxton, and True Briton have been everywhere good, Sir Joseph Paxton especially so; and of new varieties two seedlings of Mr. Simonite's will, I think, take high rank when available. One is named Samuel Cooper, and promises even to surpass Curzon; the other is called Joseph.

Crimson bizarres are a glorious class, and rejoice in a large variety. Of these I have notes of Rifleman, J. D. Hextall, Lord Milton, Lord Raglan, Marshal Ney, Eccentric Jack, Mr. Murray, and some others, but as they were unnamed they must go unrecorded until such a means of identity has been afforded.

Pink and purple bizarres are everywhere delighted in, and of these Sarah Payne, Falconbridge, James Taylor, and Satisfaction, the latter remarkable for its fragrance, should everywhere be grown.

Of purple flakes the best shown were Premier, James Douglas, Juno, and Dr. Foster. In scarlet flakes Sportsman, Clipper, and John Bayley; and in rose flakes Sibly, grand; Crista-galli, James Merryweather, John Keet, Lovely Ann, Mary Ano, and Rose of Stapleford were all fine.

Of new flowers Unexpected, C.B. (Turner), was very fine: also a variety called Rainbow, produced by Mr. Battram; Mrs. Dodwell, R.F. (Lord), requiring a few days' more growth, was well shown, and will doubtless prove an excellent addition to this already highly developed class.

In Picotees, red-edged, the varieties most to my fancy were John Smith, the premier of the whole exhibition, a flower rarely equalled; and others very superior in their characteristics were Princess of Wales, J. B. Bryant, Mrs. Dodwell, shown at Bradford so fine that in my opinion it deserved the premier prize, there awarded to Zerlina; Master Norman, also shown at Bradford, Colonel Clarke, Mrs. Gibbons, Miss Small, Rev. F. D. Horner, Mrs. Fuller, Robert Scott, Wm. Summers, and Thomas William

At Manchester, on August 4, Mr. Mellor showed a fine light purple, which obtained the 1st prize in its class, but being a single bloom only it must be seen again before a judgment can be pronounced upon it; and at the same meeting a First-class Certificate was awarded to Mr. Joseph Chadwick for his heavy-edged purple Picotee named Miss Chadwick.

I have spoken at the beginning of these remarks of the late and untoward character of the season, but exceptional as were the conditions prevailing in the South, with us they were intensified to a very high degree. So dark and sunless was the atmosphere that no ripening process could be completed, and though I fertilised numbers of seed-vessels, and the growth went forward to the stage even of developing the ovary the full length of the calyx, the calyx meanwhile being full of living petals, which I had to

sap-vessel is ruptured, or the sap diverted from its natural course, it so far affects those sleeping buds as to arouse them into life and action, and ultimately induce them to form buds, branches, and leaves. So easily are these latent buds influenced that a slight variation of temperature will do it. It is upon this known principle that thinning is practised, and by it all pruning should be regulated.

The fine, healthy, and vigorous spray that thus covers the dismembered parts and newly pruned trees during the first summer after the operation has taken place, is very apt to mislead those of limited experience, and produce fatal errors. The spray thus produced being well nourished and abundantly supplied with sap, is so far accelerated in growth as to continue growing in autumn till suddenly stopped

FIG. 145.—AGAVE ELLEMETIANA.

(Flowdy), the latter undoubtedly the best light-edged red as yet distributed.

Of purple Picotees the best I have yet seen are Zerlina, Alliance, Ann Lord, Alice, Mary, Mrs. Niven, John Delaforce, marvellous for its breadth of colour and purity of the ground; Minnie, Mrs. Douglas, and Silvia, the two latter varieties of Mr. Simonite's sent out in the autumn of 1876. Mr. Simonite also produced a lovely medium-edged purple, named Mrs. Slack, which is likely to surpass the favourite old variety Mrs. Summers.

Of rose Picotees Mrs. Allcroft, Ethel, Edith Dombrain, Fanny Helen, Juliana, Mrs. Lord, Miss Lee, Miss Wood, and Mrs. Adams, the latter a variety from Newcastle, most approve themselves to my taste; whilst of new flowers Miss Ifoiner (Lord) and Lady Louisa (Abercrombie) were very fine, and such as I think will win approval wherever seen; Fairy Queen (Hartley) has also properties which will ensure its being enquired for.

extract to make room for the swelling seed, no maturity resulted, and my labour in this direction was in vain.

I am glad to know that this experience is limited to this district, one of the highest in England where the Carnation is grown, as my friend Mr. Dodwell, unable from the backwardness of the bloom to produce his best flowers at the Aquarium, succeeded so well in fertilising them as to obtain the largest harvest of seed he ever reaped, and in due time will probably be rewarded with a corresponding number of new and desirable varieties. *George Rudd, Undercliff, Bradford, Yorkshire.*

Forestry.

PRUNING (continued from p. 654).—There are in all trees what are termed latent buds lying in readiness to embrace any favourable opportunity of appropriating the materials necessary to form active buds and shoots, and whenever any neighbouring

by frost, while the wood is yet tender and immature, and consequently a large portion of it withers and decays, and what of it remains still vital is so much weakened and otherwise injured that the leaves which next season over it are weakly, ill-formed, small, spotted, and blemished, and scarcely one of them free from disease.

The injurious effects of pruning above alluded to are not so obvious in Conifers as in hard-woods, and are most conspicuous in the Oak, Elm, and Spanish Chestnut, but are very perceptible in the Picea family, as also the Larch and Cedar.

Ten years ago the writer pruned a considerable number of Scotch Pine trees in different ways and to different degrees, from that of removing only the terminal shoots of the lateral branches to that of denuding them of all, except as many small twigs upon each branch as to keep it vital; and the invariable result was a diminution of the thickness of layer of wood in the stem, in some cases the year immediately

succeeding the operation, and in others two or three years subsequently, but in every case just in proportion to the extent of pruning done so were the results injurious as far as discernible. By way of further experiment the writer denuded some Sco's Pines, of about 6 to 8 feet in height, of all their pins or leaves, leaving only the terminal shoots covered, and the results were that, although making annual top-growths of from 12 to 14 inches the year previous, the next season they made only from 3 to 5 inches. The defoliating process was carried on two years longer (three years in all), during which time the top-growth still continued to decrease, but owing to the writer leaving the scene of experiments he cannot record further results, though the probability is they would all soon have perished.

The top-growth of a number of trees operated upon was likewise materially influenced by the foreshortening practice of pruning, but not so uniformly so as the upper tiers of the lateral branches. Those most severely pruned, or such as had their lateral branches cleared off to within one year's growth from the stem, or that part of the branch where the second year's growth begins, such trees showed a slight deficiency of growth the first season, more the second, and still more the third, and so on till the top lost its youthful character entirely, and assumed that of an aged round-topped tree.

The above experiment was made with a view of showing how the top-growth is influenced by reducing or confining the side branches, and the results shown were that the top-growth is not promoted by reducing or confining them, but is produced through shelter, by protecting the top of the tree from storm, tempest, and blighting winds, and by deep and congenial soil, by which the whole structure of the tree is nourished. This is very obvious, by what may be seen in the natural forest, where trees may be found standing singly, yet making top-growth equal to others growing in groups tall and slender as ship-masts.

Finding that pruning diminishes, or at least prevents the increase of wood, in proportion to the quantity of branches removed, the writer has devoted considerable time and labour to find out, as far as possible, what proportion of branches a well-balanced tree ought to have in order to make wood at the most desirable and satisfactory rate, neither too hard nor too soft, too fastly or too slowly grown; and in order to do this he has taken along with himself two practical men, and gone into an extensive natural forest, as well as into several plantations, and selected choice specimens of Larch, Scots Pine, and Norway Spruce. In making the selection some trees were taken which were considered perfect in all their parts and proportions; some, again, thought to have too few branches, some too tall in proportion to their girth, and others again too thick for their height. These conditions, be it observed, were unanimously agreed upon by all there, and written down before the tree to which they referred was cut, pruned, dissected and weighed.

After a protracted and minute inspection of all the parts, and specially of the concentric rings by which the annual deposit of cambium is known, it was found that too few rather than too many branches was the defect, and that it was comparatively rare to find trees in regular plantations between fifteen and thirty-five years old with sufficient branches upon them to sustain a proper and profitable growth.

Of the common species of Coniferæ none require or endure pruning so much and so well as the common Larch and Silver Fir. Both are disposed under certain conditions to produce a plurality of stems, and both submit well to their removal, which is quite an essential operation, in order to attainment of good and profitable trees; and beyond this thinning rather than pruning is preferable.

Without further going into the subject at present, but far from exhausting it, I conclude with a view of resuming it at a future time. C. Y. Michie, Cullen House, Cullen, N.B.

The Villa Garden.

THE difficulties that beset those who delight in cultivating a few plants, but whose knowledge of their requirements and the simplest rules of management are of a somewhat vague character, was forcibly illustrated a few days ago in the case where an attempt had been made to winter a few plants in a cold frame. The plants were Pelargoniums, Fuchsias, Caladiums, and other things of that character—subjects that can be wintered in such a frame with comparative safety, if only the right means are adopted. In this instance the cultivator had made a few mistakes, and these mistakes, if set forth, may serve to show others certain

perils to be avoided. In the first place the frame was placed in the worst part of the garden, where if damp accumulated anywhere it would be sure to be found: it was under the drip of trees—it was placed in a hollow towards which the surface water naturally rose, and the plants were quite at the bottom of a deep frame, with the cold wet bottom below the pots, and the branches far removed from the glass. It was almost next to impossible that plants could be safely wintered under such circumstances. The frame should have been in the driest part of the garden, in the open rather than near trees; the site should be drained, so that water might be drawn away from it rather than impelled to it, and there should have been a raised bed of buick rubbish within the frame to keep the bottom dry and warm, as far as warmth could be obtained from it, and the heads of the plants near the glass so as to have the benefit of sunshine and drying winds. With a dry bottom assured and warm covering over the frame in severe weather the plants, if kept dry at the roots (avoiding, at the same time, that extreme dryness that would cause death), may be wintered with safety. The placing of a lighted candle in the frame of a night, when the frost is most intense, does wonders in the way of preventing injurious effects. Not long since an amateur gardener thought he had hit upon an excellent expedient for wintering plants in safety, and he set to work to dig out a kind of bed in his garden, and round this he built up a wall of half long fresh stable dung round his bed, intending to put a light on the top of it when completed. He had placed in it a quantity of cuttings of Pelargoniums in capital condition, thinking that the warmth from the dung would keep the plants secure from harm all the winter, but was quite forgetful of the ill effects of damp, which would have played sad havoc with the plants. Another difficulty to be surmounted is that of keeping plants sufficiently watered during the winter. Writers sometimes state that plants should not be watered during frosty weather, which is quite true as a general rule, but at the same time it is advice that must not be fully carried out under all circumstances. It is possible that a long spell of frost may happen with bright sunshiny and even warm days. Plants will dry fast, and besides the fire-heat employed, in whatever form, to keep out frost, will also aid the drying process. These two influences soon dry up the soil in the pots, and plants die from drought as well as from over-much sunshine. Water should be given sufficient to keep the plants alive, but not to encourage them to grow; it should be done by eleven o'clock in the morning, to allow of the soil draining a little by night, and when the sun is bright a little air may be given, but on the sunny and leeward side. These remarks apply more particularly to those who winter plants in unheated structures, and whose only chance of resisting frost is by the employment of a portable stove or lamp, or some such means of increasing the temperature.

Notices of Books.

Ferns of the British Isles, *Described and Photographed*. By Sy. C. London: Van Voorst.

The peculiar feature of this book is found in the photographic illustrations, which represent the species of British Ferns, in a series of eighteen plates, the plants being variously reduced from three-fourths to one-tenth the natural size, and two or three species being usually represented on a plate. The figures, though small, are generally clear and characteristic. The book is nicely printed, and elegantly got up, and is just suited for a drawing-room table. Brevity is one of its characteristics; indeed we are told that the contents are limited "to an accurate and concise account of each section or group, genus, and species," information on other points being purposely omitted. Some of the definitions are not so accurate as this would lead one to suppose; for example, under *Adiantum* it is affirmed that the membranous margin of the pinnules is "prolonged over the sori," which does not properly indicate the structure of the fructification in this favourite genus, in which the sori are affixed to and hang from the under-surface of the indusium, and are not merely covered by it, so that consequently any prolongation of this "membranous margin" would not lie over the sori, but beyond them. We cannot moreover agree with the author in referring *Polypodium flexile* to *Athyrium*, nor *Lastrea remota* to *Lastrea Filix-mas*.

— The *Gardeners' Year Book* for 1878 (*Journal of Horticulture* office, 171, Fleet Street) has just been issued. The utility of this little publication has been tested by eighteen years' successive reproduction. Like its companion the *Horticultural Directory* it is indispensable in every garden office.

— Issued under the auspices of the Secretary of the National Rose Society the *Rosarian's Year Book* for 1877 (Blackwoods) has disappointed us. There is an interesting paper on the weather by Mr. Edward Mawley, a valuable one by Mr. George Paul on the stocks used for Roses, and some others, but the reports of the Rose shows, for the most part fully chronicled in the gardening papers of the day, are surely too much like *cranbe bis cocta* to be of any value now.

A FLOWER HYMN.

GLORY to God for flowers!
They lift our thoughts from care;
So lovely hast Thou made them, Lord,
They seem Thy smile to wear.
Red Roses tell Thy heart,
Glowing with love divine,
Deep pierced for a world of sin,
That we might all be Thine.
To show Thy spotless robe
Is to the Lily given;
The robe Thou givest to Thine own,
That they may dwell in heaven.
The many fragrant blooms,
Each with a separate grace,
Thy Spirit's various gifts pourtray
In each true Christian race.
Others we love not least,
Yet wear no colours gay;
Like some who do a world of good
In their own quiet way.
The ever welcome flowers
Can health or sickness bless:
Lord, keep those selfish hearts of ours
From utter thanklessness.
Glory to God for flowers!
We would our praise renew;
Lord, send upon our thirsting hearts
Thy holy grace, like dew.
"St. Andrew's Magazine," D.rby.

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—Although from long and repeated experiments I am no advocate for bottom-heat, except to such plants as can be made to do better with it, yet the presence of a good body of tan in either a stove or intermediate-house benefits the plants in several ways; the gases given off whilst it is strongly fermenting are evidently an advantage to plants, as exemplified by the healthy appearance of the leaves where it is used. In houses devoted to subjects that require through the winter the continuous application of fire-heat, there must be some continuous means of providing moisture for the atmosphere to counteract the drying influence of the pipes or flues. This, no doubt, as is usually done, can be supplied by troughs or evaporating-pans, but there is one difficulty in their use, that in mild weather—such, for instance, as we have experienced for some weeks—the less heat in the pipes required will have caused comparatively slower generation of moisture from the evaporating-pans, necessitating more of them being kept filled. When the transition from mild weather to severe frost occurs, often very suddenly, this naturally requires the water in the pipes being kept at a much higher temperature, frequently, on severe nights—near to the boiling point; as a matter of course this produces a corresponding increase in the evaporation from the pans or troughs, often to an extent that causes all but a saturated state of the atmosphere, which by no means should occur. Where a good body of fresh tan exists, the moisture given off from it goes far to supply the atmosphere of the house with the moisture required by the plants, reducing in a comparative ratio the necessity for keeping the trough pipes filled. In the case of houses where nothing but ordinary pipes without troughs exist, and where the only available means for moistening the atmosphere is by throwing water on the floors, stages, &c., the tan, from the fact of its continually giving off moisture, is of still further assistance. Independent of the above considerations it materially assists in keeping up the temperature, and from this fact alone its use is a matter of wise economy. To reap the full benefit of its effects, I have found the present the best time for getting it in; in years past in country places where English bark was exclusively used for tanning pur-

pcses, roughly ground, a considerable portion of that which had been used the preceding year was so little decomposed as by sifting to be available for mixing with the new; but where foreign bark is employed, finely ground, by the end of a year there is seldom anything left fit for use that would make it worth while going to the trouble of sifting, and when the whole is cleared out and new substituted a longer period elapses before it gets infested with worms so as to make them troublesome. For this reason the tan should always be used as fresh as it can be obtained directly it is taken from the pits, before it has had time to lie. In clearing the old out it is a good plan, with a view to the eradication of worms, to lime-wash the inside walls of the pits, and to strew on the bottom half an inch of newly slaked lime. If these precautions are taken, and means used to eject the worms from the soil in the pots that are ultimately to be stood on or plunged in the tar, it will have a material effect in lessening the number of these pests, which have such an injurious influence on plants generally by not only clogging up the drainage, but reducing the soil to a putty-like consistency ill adapted for the roots making healthy progress. The removal of the plants requisite for getting in the tan gives a good opportunity for cleaning the glass and woodwork.

In the vicinity of towns, where there are now such a number of glass erections for the cultivation of plants of all descriptions, it is necessary in the course of the year to wash the houses several times, both inside and out, to secure the admission of the greatest possible amount of light, as in such situations the atmosphere is so far charged with soot that the glass gets obscured in a way that keeps the plants much darker than they should be; even where the atmosphere is of the purest, stoves, by generally being in a position nearer the furnace than cooler structures, need more attention than they often get in this. This vital question of light is a matter that forces itself much more upon gardeners at the present day than in more remote times, when stove plants generally were kept in a comparatively low temperature through a good portion of the winter until there was a greater amount of solar light. Now, in most places, the regular and unceasing demand for cut flowers is such that many things have to be started earlier, necessitating the keeping up of a higher temperature, which excites growth, rendering every ray of light of paramount importance.

More Gardenias and Bouvardias should now be introduced to the warmest house at command. I should by no means advise Gardenias that are thus to be brought on into flower in a high temperature to be plunged in bottom-heat; no doubt where there is any deficiency of top-heat it will have the effect of causing the blooms to expand quicker, but the flowers so brought out will be of much shorter duration when cut than if grown without bottom-heat; and this holds good not only of the above plants, but also of most things that require a high temperature to bloom in winter. Another batch of Poinsettias, Euphorbia jacquiniiflora, Plumbago rosea, Thyrsacanthus rutilans, and Sericographis Ghiesbreghtii, should be removed from the intermediate temperature where they have been located during the autumn to warmer quarters, so as to succeed such as flowered earlier; by thus bringing these things on at intervals, the stove never looks quite so gay, but where there is a continuous demand for flowers the supply is much more effectually insured. *T. Baines.*

ORCHIDS.—Plants of *Dendrobium Falconeri*, whether grown in baskets or on blocks, in which condition in all probability the growths are allowed to hang down below the basket, &c., or whether, which is far better, the plants are grown in pots, and the bulbs tied up to and around a number of stakes, will, now that the plants for the most part have ceased growing, and the small lateral shoots that start away from the main bulbs have swollen and plumped up considerably, be treated to a more rigid course than has hitherto been adopted with them. The amount of water at the roots, which has gradually been diminishing, must now be withheld altogether, and the plants taken from the *Dendrobium*-house and stood or hung in a division where it is much drier and cooler, where the night temperature at present is about 45°. Should cold weather come on, a night temperature of 40° will not injure them. Here they should be so placed that they will not come in contact with cold cutting draughts when air is given during the daytime. Here they will keep with safety, and, in fact, it is only by thus resting and ripening them that any number of blooms can be obtained upon them in their proper season. The small-growing *D. pulchellum* having now also finished its growths must be stood with the *Falconeri*, and the least possible amount of water given for the next three months. Plants of *D. crassinode* as they show the buds for bloom along the newly-formed bulbs must be stood or hung again in the warmer division. At first they will need only a small quantity of water; but as the buds increase in size, and at the same time the breaks push away at the base of the flowering growths, it will be necessary to give more, so that the flowers and growths may not receive any check. *D. Wardianum* will also be

found in about the same forward state as the preceding, only the growths being a little more forward the water required just at present will be a little more. The earliest *D. nobile* should now be in bloom or advancing quickly: a regular supply of these from December to May can easily be managed if a little care is exercised in placing the first ripened plants in the cool, and bringing them back into a gentle heat as they are required. *D. Ainsworthii* requires treating so exactly like *nobile*, and has proved to be such a free bloomer, that as every season it becomes better known it will be found to be one of the very best of the winter blooming varieties, as well, too, as being invaluable as an exhibition plant. In the *Cattleya*-house it will be seen that the true *C. Warneri* is just starting into growth, and the roots, too, showing signs of renewed activity. This, it must be remembered, flowers on the new growths; therefore when once the breaks show signs of life they must be encouraged and assisted so that nothing should hinder their full development, and that their flower-sheaths may be formed to enclose and protect their most magnificent blooms this should now be placed at the warmest end of the *Cattleya*-house, and watered with care and discretion during the dull and dreary months before us. *Cymbidium Mastersii* and *eburneum*, though very much alike in general appearance, and both natives of Northern India, are found to succeed best when treated to a little less heat than is given to the majority of plants from that vast empire. They should be grown in the *Cattleya*-house, where the foliage will keep a much better colour and be less liable to become spotted than when grown in a strong heat. *Mastersii* should now be in flower, whilst *eburneum* will soon be showing, so that its large and showy blooms may be opened by March and April. *D. Parishii*, too, succeeds well in the *Cattleya*-house; the imported plants of this, however, have bloomed only on rare occasions, if at all. *Dendrochilum glamaesum*, now breaking freely, must be stood in the East India-house, and treated to very liberal supplies of water. *W. Swan, Fallowfield.*

FLOWER GARDEN, ETC.

After the leaves are all swept up and wheeled to the rubbish-yard, or out-of-the-way corner in the shrubbery during damp or stormy weather when ground-work cannot so well be got on with, the heap of leaves, grass, &c., may be turned over, which in due time will become available for wheeling on the flower-beds and borders. In many gardens, where manure is scarce, this compound comes in very useful. As the ground is now unusually wet, plants are not in the most favourable condition for withstanding severe cold; have sufficient protecting material in readiness to cover up tender plants in the open air or cold pits and frames, for although the season up to this time has been unusually mild, a change may suddenly occur, and if not anticipated much damage might be the result. While the weather is favourable push forward all planting; where hedges of deciduous plants of evergreens are required the ground had better be trenched, and if the soil is dry and porous it will be greatly improved by a good dressing of well-prepared manure, which will afford the plant considerable nourishment, especially in dry hot weather. Give pits and frames air on every favourable occasion, so as to keep them as hardy as possible, and take care the plants do not suffer from too much wet, which at this season of the year is very injurious, most of the things being in a state of rest. In places where the turf has become unlevel the holes may be filled up with sand or any light soil, and after being well rammed the turf will be put back in its former place and well beaten, then a few turns of a heavy roller will give it the finishing touch. Gravel may be collected, and had ready for renewing the walks after the season is further advanced. *T. Blair, Shrubland Park.*

FRUIT HOUSES.

FIGS.—The trees which were started last month will by this time be breaking forth into growth. At this period of the year, with sunshine and daylight at its lowest pitch, there is with this particular subject just a risk of hastening forward the growth too rapidly, so that its character will be attenuated and weakly. Be content, therefore, during the next month or so with a steady course of progress being made in this way. As soon as the leaves on the trees begin to expand 55° at night may be safely allowed, and this condition be advanced 5° more by daylight every morning, and be maintained whilst it lasts. Use tepid water for syringing the trees, and apply it over them every morning and again early in the afternoon if the moisture from the preceding application has disappeared. At 65° open the house a little way at its apex, and keep it so until such time as it is likely to fall beneath this point, when it should be closed up. If fermenting matter is employed in the house the vapour which arises from it will at times accumulate on the glass, and render it somewhat impervious for the free and full access of light and sunshine. This matter should at all times

command attention, and it should be removed whenever necessary, as these important elements are now much required. Stop the shoots when they have made about five leaves, and take away entirely those which are not wanted. Exercise care in watering, giving it only when really necessary, and then plentifully. Now is a good time to commence a house with permanently planted trees, if ripe Figs are wanted at about the beginning of next June. The same temperature as indicated above will be suitable here for the present. *G. T. Miles, Wycombe Abbey.*

ORCHARD HOUSE.—In many places it is now becoming the practice to obtain a few early Peaches and Nectarines from trees established in pots, placed in a forcing orchard-house. Where this course is followed, such kinds as Euly Louise, Alfred, Grosse Mignonne, Hale's Early, Abco, and York Peache, Lord Napier and Elruge Nectarines, may now be taken in, and placed at once where they are to stand for the season. If the plants have been out-of-doors the soil will be sufficiently moist, but if they have been kept under glass the first care must be the gradual application of tepid water to the roots until every particle is brought into a growing state. Let forcing commence with open ventilators and sufficient fire-heat to maintain a minimum temperature of 45° with a rise of 5° to 10° by day. Syringe the trees two or three times a day, and damp all available spaces when the weather is fine, but guard against keeping the trees wet through the night. Should the weather become very cold and unfavourable, the supply of atmospheric moisture must be regulated by the amount of light and ventilation, as an excess of water is often as injurious as the want of it. Where this early compartment is to be succeeded by another containing the general stock in January, the trees may be kept out-of-doors until the end of the month, providing the weather continues mild, but in the event of a severe frost setting in they may be housed at once. *W. Coleman, Eastnor.*

CUCUMBERS.—The mild and open weather which has hitherto prevailed having been highly favourable to winter Cucumbers, plants in all stages are now looking well, and will continue productive so long as the cultural directions laid down in my last can be followed, and sudden checks in temperature are carefully guarded against. Where bottom-heat is partly produced by fermenting Oak leaves, a good stock must be always ready for taking into the pit, as a sudden check to the roots is often more injurious than a temporary depression of the internal temperature of the house; but the latter should and may be guarded against by the use of blinds, or some kind of covering at night and in bad weather, independently of the fact that a great deal of hard dry firing is saved thereby. Steadily remove old foliage and exhausted growths from bearing plants, and lay in all young growths their full length, so as to keep the trellis nicely covered with clean healthy young foliage. Be moderate in the use of atmospheric moisture until the days begin to lengthen, and discontinue filling the evaporating pans in dark damp weather. If plants that have been a long time in bearing show signs of exhaustion, they may be rested and strengthened by the entire removal of all fruit and flowers, moderate top-dressings with fresh turf previously warmed, and the frequent application of weak tepid liquid-manure. The latter is an excellent thing for syringing over beds, paths, and walls when plants are forced to yield heavy crops of fruit to meet the demand. Avoid the use of manure if possible, either for producing heat or mulching, as it only encourages worms, and the remedies, lime or soot-water in large quantities, often do considerable injury to the plants. Watch for red-spider and mildew, and apply flowers of sulphur or a weak solution of Gishurst, and use Pooley's tobacco-powder in preference to smoking for the destruction of green-fly. Do not distress the plants by allowing the fruit to attain full size before they are cut, and if not wanted for immediate use roll up in paper and keep in dry moss. Collect Oak leaves for next season, and store under cover before they get injured by the wet. If there is likely to be a scarcity of plants for early spring work a few cuttings may now be inserted in small 60's and placed under bell-glasses in a strong bottom-heat near the glass. *W. Coleman, Eastnor.*

THREE ILLUSTRATIONS OF A THEORY.

THOUGH dogmatists and dullards long opposed His Theory with venomous persistence; Darwin may now consider it has closed.
It's—"Struggle for existence."

To calm research, not fierce polemic raid,
Truth yields her secrets. After firm inspection,
The age 'twixt Science and her tocs has made
A—"Natural selection."

Thou canst not, Zealotry, as blind as hat,
Truth's champion slay, however hard thou hittest.
Darwin outlives detraction. Is this not
"Survival of the fittest"?—*Punch.*

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 15, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Dec. 17	Sale of about 13,000 Bulbs of <i>Lilium auratum</i> , at Stevens' Rooms.
WEDNESDAY,	Dec. 19	
THURSDAY,	Dec. 20	Sale of Plants and Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	Dec. 21	Meeting of the Linnean Society, at 8 P.M.
THURSDAY,	Dec. 20	Sale of Orchids, at Stevens' Rooms.
SATURDAY,	Dec. 22	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THERE can be little doubt that the new race of TUBEROUS BEGONIAS is destined to play an important part in the decorative gardening of the future. The Begonia is, so to speak, the coming flower, though, as our illustration shows, it has already made its advent amongst us, and some very beautiful forms, of which those we have figured are a mere gleanings, have been already obtained, while each year they go on improving in quality and increasing in beauty.

It is mainly due to the introduction of *B. boliviensis* and *B. Veitchii*, with one or two less conspicuous allies, that we owe this new race of ornamental plants, which have the recommendation of being most abundant and continuous bloomers, and of being of the easiest culture. The old *B. Evansiana*, or discolor, of our grandmothers' gardens, which was usually cultivated on the window-sill and wintered in the china-closet, is, horticulturally speaking, very closely allied to the modern forms; but the latter, in the brilliant richness of their colouring, possess at least one great advantage over the older and more familiar form.

There are two particular lines along which we may expect to see the tuberous Begonias extending themselves, namely, as greenhouse summer decorative plants, and as bedding-out or rock plants. In each of these they have already distinguished themselves.

As indoor decorative plants they come at a season when they are especially useful, namely, at the time when greenhouse flowering plants are becoming scanty, and when for the most part recourse must be had to the tender annuals. For this decorative use their free branching habit, and the abundance of flowers they produce while still of moderate size, eminently adapt them. Their usually rich and now varied colours particularly recommend them for this use. *B. Evansiana*, with its charming rosy-pink flowers, is in every way adapted for their companionship, since it requires the same mode of culture. Their introduction has at least taught cultivators how to grow the delicately beautiful, rose-coloured bulbous *B. Martiana*, which, drawn up and lanky as commonly seen under stove treatment, would not be known as the same plant under the cooler greenhouse treatment which these novelties have taught us to adopt.

Then as to bedding-out and furnishing rock-work, the success which has already been realised is most encouraging. As a rock plant *B. Veitchii* is one of the most brilliant, and this has been treated successfully on the open rock-work in the climate of London. We may, therefore, look for other varieties equally hardy, especially since the very distinct *B. Davisii* also comes from very elevated habitats. But irrespective of their capability to withstand our winters outdoors we know of no more charming subjects than such plants as *B. Veitchii*, *B. roseiflora*, and the improved forms allied to them, for occupying snug corners during the summer months. The varieties of the *B. Sedeni* type are remarkably floriferous and effective in the summer beds, where they are less affected by sharp showers of rain than the beds of *Pelargoniums*. Experience teaches; and so as we find available material for bedding-out

amongst the earlier hybrids, we shall be led to look out for others amongst the more advanced types, when we shall get larger flowers and greater choice of colour. Their capability of bearing up against heavy rains is a quality one could scarcely have expected of them, and the knowledge of it is, therefore, all the more welcome.

The accompanying illustration will give some idea of the brilliant colouring of the modern varieties. Those here represented are all, we believe, raised or introduced by Messrs. VEITCH & SONS, of the Royal Exotic Nursery, King's Road, Chelsea; though other growers, notably Messrs. PERKINS, BULL, LAING, WILLIAMS, CHAMBERS, and MCLELLAN, together with M. LEMOINE and M. VAN HOUTTE, have realised good results. Our figure consists of *B. Davisii* (fig. 1); *B. Emperor* (fig. 2); Mrs. C. Scorer (fig. 3); Queen of the Whites (fig. 4); and Acme (fig. 5). With these representations at hand, the reader will need no technical descriptions. We may, however, remark that *B. Davisii* is of dwarf herbaceous habit, and Mrs. C. Scorer is dwarfer and less branched than the other larger sorts.

THE DISTRIBUTION OF PLANTS as affected BY MAN, directly or indirectly, presents some very singular anomalies. As might be expected, the spread of what may be termed the weeds of cultivation has been in the same direction as the tide of emigration of different peoples. But it is a remarkable fact that comparatively few of the numerous perfectly hardy exotic trees, shrubs, and herbaceous plants commonly cultivated in this country have become naturalised, or under the most favourable circumstances would reproduce themselves unaided. Even the number of cornfield weeds has increased very little since the publication of HUDSON'S *Flora Anglica* in 1798. It is not altogether owing to careful cultivation, though this must be taken into consideration, because even now in many parts of the country the crops are left to battle with the weeds to such an extent as to give the latter the advantage; and because the most careful farmer finds it impossible to prevent the spread of certain weeds. Some plants possess such an amount of vital energy and reproductive power that, once fairly established, all the agencies that can be put into operation fail to arrest their onward march. *Veronica Buxbaumii* is an example of an introduced species that has spread so much within the last few years as to have become, from a rare plant, exceedingly common and abundant. *Geranium pyrenaicum* and *Diploxis muralis* are two other plants which are rapidly gaining ground in the South of England. Another noteworthy fact is the small number of American plants that have established themselves in this country. *Anacharis canadensis* is the only one we can call to mind at the moment that has become a formidable enemy, and this, unlike those just named, has spread simply by extension, as only one sex is known here. *Galinsoga parviflora* is rather abundant in some of the market gardens near London, and a few other American plants are locally abundant. But our climate, although permitting the cultivation of a vast number of plants from various parts of the world, is, on the whole, unfavourable to colonisation. In contrast to this the slightly warmer countries of the southern hemisphere are too favourable to the development of European plants purposely or accidentally introduced by settlers. We recently noticed a pamphlet on the European plants which have become wild in Buenos Ayres and Patagonia. Upwards of 150 species are enumerated, 100 of which are British; and some of them have absolutely taken possession of square miles of country. One species of *Cynara*, it is stated, covers hundreds of square

miles. New Zealand and Australia are equally overrun by European weeds; and in North America, too, they are very numerous and troublesome. The flora of Portugal, perhaps, of all European countries, has suffered most change from the naturalisation of plants from the southern hemisphere, and alien species from other parts of the Northern hemisphere. According to Dr. GOEZE'S recent sketch of the vegetation in the *Linnaea*, Australian shrubs seed freely and show every disposition to spread, unassisted, over the country. Among South African plants fully established and some of the exceedingly common are: *Oxalis cernua*, *Amaryllis belladonna*, *Gomphocarpus fruticosus*, *Arctotis acaulis*, *Senecio scandens*, and various species of *Mesembryanthemum* and *Pelargonium*. America is represented in the wild flora by *Opuntia vulgaris*, *Agave americana*, *Yucca aloifolia*, *Chenopodium ambrosioides*, *Nicotiana glauca*, *Mimulus luteus*, *Datura* spp., *Physalis peruviana*, &c. Examining the general tendency in the spread of plants, we find it to be in the direction of a gradually warmer climate.

— A CASE against some well known SEED DOCTORS, tried at the Southwark Police Court on the 10. inst., failed on account of a technical flaw in the Act of Parliament. The facts of the case were not disputed, but the wording of the Act left no option to the magistrate but to dismiss the summons, subject, however, to the right of appeal. We are informed that the opinion of the Court of Queen's Bench will be taken on the matter. In another column we give a report of the case, which excited great interest among the seed trade, who are, we believe, thoroughly in earnest in their endeavours to put down these fraudulent practices.

— At a meeting of the Council of the ROYAL AGRICULTURAL SOCIETY OF ENGLAND, held on Wednesday last, Colonel KINGSCOTE, C.B., M.P., President, occupying the chair, the Botanical Committee presented the annual report of the Society's Consulting Botanist (Mr. CARRUTHERS), in which it was stated that the samples of seeds for crops which had passed through his hands had been generally satisfactory, and no case had occurred to him this year in which either killed or spurious seeds had been foisted upon the purchaser. The samples condemned by him had been defective either through the presence of worthless or injurious weeds, or through bad or careless harvesting. It was satisfactory that, so far as his experience went, the members of the Society had not been imposed upon by the killed and coloured seeds which recent prosecutions had shown to be again found in the market. The extent to which killed or dead seeds are present in any sample might easily be determined by the purchaser, and no farmer should sow low-priced seed, or seed in any way suspicious, without experimenting himself or submitting it for examination. He believed no danger was to be feared from the trade generally, but unprincipled dealers in large towns were now known systematically to increase their profits by means of adulteration. The worthless article was generally imposed on general dealers who supplied seed but had no practical knowledge of this department of their business, and who retailed in good faith what they had purchased in lowest market as good seed. The committee also stated that they had had under their serious considerations the startling disclosures made during the recent prosecutions already referred to, and they recommended that the Council give them similar power to that at present possessed by the Chemical Committee to present quarterly reports on the cases of adulterated, killed, coloured, and inferior seeds brought under the notice of the Consulting Botanist, for publication, together with the names of the vendors (subject to the approval of the Council) in the agricultural newspapers. They further recommended that for the future it should be styled "The Seeds and Plant Diseases Committee." These reports were adopted.

— The annual meeting of the ROYAL CALDONIAN HORTICULTURAL SOCIETY was held in the Music Hall, Edinburgh, on the 6th inst. Mr.

THOMAS METHVEN occupied the chair. From the financial statement submitted by the Treasurer, Mr. FRASER, it appeared that the receipts during the past year amounted to £713 14s. 1d., including £416 16s. for annual subscriptions, £39 4s. for special prizes, and £214 18s. 6d. for drawings; at the various shows. The expenditure in the same period was £697 7s. 10½d., which included show expenses to the amount of £256, and prizes to the value of £362. The balance on the year's transactions was thus £16 6s. 2½d. On November 30, 1876, the funds standing at the credit of the Society amounted to £518 4s. 6½d., while at the corresponding date of the present year they were £534 11s. 9d. The Chairman congratulated the Society upon the continued prosperity which was attending it year by year; and the adoption of the report was approved of. On the motion of the Chairman, seconded by Professor BALFOUR, Mr. MACONOCHE WELWOOD, of Meadowbank, was appointed a Vice President of the Society, in the place of the Earl of STRATHMORE, who retired by rotation. Mr. MACKINTOSH was elected to a seat on the Council in the place of the nurseryman who retired by rotation, and Mr. PATERSON, Meadowbank, was selected to fill the vacancy on the Council for a gardener. The Secretary, Mr. STEWART, and Treasurer, Mr. FRASER, were re-elected, and specially thanked for their past services. The Chairman mentioned that the next spring show of the Society was likely to be held in the Waverley Market, and being open for the first time to the world it would most probably be the largest and grandest exhibition of the kind ever held in Edinburgh.

— The sixtieth annual general meeting of the proprietors of the ROYAL BOTANIC INSTITUTION, GLASGOW, was held on the 10th inst., and we gather from the annual report that the joint account, which embraced all the branches of revenue and expenditure in which the Garden and Palace Company mutually participate, shows an increase in the divisible balance, when compared with last year, of £79 5s. 10d. The number of annual subscribers remains almost unchanged, the increase being only seven family, four single, and four office tickets. The surplus on the promenade account is £87 12s. As in previous years, the gardens were thrown open to the working classes during the Fair week, and an entertainment of an amusing character was given in the conservatory at a charge of 6d. per head for adults, which was attended by upwards of 15,000 persons, yielding a nett surplus, after meeting all expenses, of £151 6s. 3d. The directors are glad to report that they have been able to keep the expenditure within the most moderate limits. The sum of £342 6s. has been realised from the sale of new shares. The old conservatories are now in an even more dilapidated condition than formerly, and are of course getting gradually worse, but the directors have not seen their way during the year to take any steps towards raising funds for their reconstruction. The new houses continue to give the utmost satisfaction, and are chiefly instrumental in enabling the curator, Mr. BULLEN, to maintain the garden in the highly creditable condition which it has attained under his skilled and careful management. The Professor of Botany in the University has been regularly supplied with specimens for the use of his class during the year, and every facility has been afforded for his demonstrations.

— At a meeting held recently in the Town Hall at MANCHESTER—present Mr. BRUCE FINDLAY (in the chair), B. S. WILLIAMS, R. TAIT (DICKSON, BROWN & TAIT), J. ROBINSON (DICKSON & ROBINSON), R. P. KERR, of Liverpool, and several other gentlemen engaged in horticultural pursuits—a local committee was formed to promote the interests of the GARDENERS' ROYAL BENEVOLENT INSTITUTION, and Mr. CUTLER, the Secretary of the Institution, had the pleasure of adding several names to the list of yearly subscribers, besides a few life subscriptions. Eight pensioners will, we learn, be added next January.

— We learn from the *Irish Farmers' Gazette*, that Alderman Sir J. W. MACKEV, the well-known Dublin seed merchant, will shortly remove his business, so long carried on in Westmoreland Street, to more commodious premises adjoining the Gresham Hotel, in Upper Sackville Street. Our contemporary has had an opportunity of inspecting the new

premises, and can safely congratulate the proprietor on being able to introduce his numerous clients to an establishment which, for convenience, extent, and purposes of display, will be, perhaps, second to no establishment of its kind. Tradesmen have been for some time, and are at present, hard at work in order to have the new concern open and in full business swing in the first week of the new year.

— In an elaborate paper read on Wednesday last before the Society of Arts Mr. J. B. LAWES argues against the RESTRICTIVE COVENANTS usual in farm leases. He has no difficulty in showing that in the improved state of agricultural science, particularly in the application of chemical manures, they are no longer necessary for the protection of the landlord, while they act injuriously on the farmer and the general public. Mr. LAWES' paper contains several interesting details which our space does not allow us to insert now, but which we may take an early opportunity of bringing under the notice of our readers.

— The *Medical Examiner* states that the *Transactions of the Medical Society of Upsala* contains an account of an ingenious piece of RASCALITY IN THE HOP TRADE, said to be practised on a considerable scale in that city. Hops which have already been used for making extracts, or for brewing in the ordinary way, are damped with tincture of absinthe, or wormwood, freed from spirit by distillation, re-dried, and then placed upon the market as a genuine article, with or without the addition of a little fresh bloom. Owing to their increased bitterness they often command a better price than unadulterated Hops.

— JASMINUM DIDYMU is an elegant twiner, profusely flowering in the porch of the Lily-house at Kew. It has rich dark green foliage, composed of opposite ternate leaves, in the axils of most of which are panicles of pure white flowers, strongly and agreeably scented. The leaflets are usually ovate, sometimes oval, the middle one as a rule the largest, its length in average specimens being about 2 inches. The flowers, though they are little more than the fourth of an inch in diameter, and in rather Ligustrum-like panicles, have yet a pleasing effect, especially at this season of the year. It has perhaps not been figured in any botanical work; in several horticultural books there is no reference to it. At Kew it has long been cultivated, though perhaps scarcely known elsewhere. It is a native of the Society Islands.

— M. LINDEN informs us that the beautiful CARLUDOVICA DRUDEL, figured by us in our last issue, was introduced by him several years since, and has been inserted year after year in his catalogues under the name of *C. speciosa*. As we never saw M. LINDEN'S plant, and no figure or description of it has been hitherto published, the name *C. Drudel* must be maintained.

— There has always been considerable doubt about the real nature of that curious fungus PTYCHOGASTER ALBUS. FRIES stated that he considered it a degeneration of *Polyporus destructor*, but there was no evidence to confirm his view. A specimen has, however, now been sent from Glamis by the Rev. J. STEVENSON, which at least makes it clear that *Polyporus destructor* has something to do with it. Before making a section, part of the specimen was seen to be in the usual condition of the *Ptychogaster*, consisting of erect irregular threads and abundant ochraceous spores, the other half exhibiting something like sinuous pores, but so soft and tender that it was difficult to say what their real nature might be. However, on making a section not only was a white, firm base discovered, but pores in the normal condition of those of the *Polyporus* in question. It does not seem, however, that it is a degeneration of the *Polyporus*, but rather the work of a parasite, which modifies the matrix in the same way that *Nyctalis* and *Boletus* are affected by their peculiar parasites. The parasite, however, cannot be referred to the *Myxogastres*, nor do the threads seem to belong to the parasite, but to be derived from the matrix, just as those are which occur in *Ustilago olivacea*. M. J. B.

— CALLIPHURIA HARTWEGIANA is an extremely pretty white-flowered evergreen bulb from New Grenada, introduced by Mr. BULL, and now in flower in the stove at Kew. In each umbel are six to

eight funnel-shaped flowers which open in succession, and are rather more than an inch across. It is a smaller plant throughout than *C. subdentata*, and, like it, is evergreen. It flowers freely at this season with the same treatment as *Eucharis*, to which it is allied, and possesses also a similar habit.

— The collection of cut flowers of ZONAL PELARGONIUMS exhibited by Mr. H. CANNELL, nurseryman, Swanley, at the last meeting of the Royal Horticultural Society, illustrated in a remarkable manner the value of this popular flower as an autumn decorative plant for houses. It could not but be noticed that the flowers possessed a size, substance, and brilliancy and depth of hue unknown to them in the summer. One variety in particular—David Thomson—having on this occasion the finest form in petal and pip, is said by Mr. CANNELL to be quite loose in form during the summer; and he has found by experience that several varieties that are somewhat poor in character in summer shine out with surprising force in form and colour in autumn. How true this is of the pink-flowered varieties? For with the declining days and the dulness peculiar to the season, they take on a radiance unknown to them in summer, when the skies are clear and the "sun's direct ray" is tempered by no shade. The plants from which these fine flowers were taken were late spring-struck cuttings, finally potted in August; and, by the aid of a little fire-heat in his Pelargonium houses, Mr. CANNELL hopes to be able to send cut blooms of Zonals to the meetings of the Society during the winter. It will be seen Mr. CANNELL relies on young and vigorous plants to supply these superb floral results. The hint should not be lost, for some have confessed to failure, and failure has probably come because the plants looked to furnish flowers were those which had already done good service during the summer.

— We have received a prospectus of a company which has been formed in Dublin for the purpose of purchasing and carrying on the business of the *Irish Farmers' Gazette* as an agricultural weekly publication, also the printing and sale of the *Farmers' Almanac*, *Farm Account Books*, and other agricultural works, together with general printing business carried on at 23, Bachelor's Walk, Dublin. The secretary *pro tem* is Mr. JOHN PURDON, and the capital £20,000, in 2000 shares of £10 each.

— The fruit-head of a species of PANDANUS from India, forming a brush, of which the fibrous tissue of the drupes constituted the bristles, was shown by Mr. THISELTON DYER to the Fellows of the Linnean Society (December 6). This novel brush, it is said, is used to scrape or dress cloth, similarly to our Teazle (*Dipsacus*).

— The Government are setting the metropolitan vestries a good example by PLANTING TREES largely in and about the ROYAL ARSENAL AT WOOLWICH, some thousands of young trees having been sent there from Kew Gardens for that purpose. These are being planted in rows by the sides of the avenues and workshops, and in groups wherever space is available. It is anticipated that in a few years the general appearance of the Royal Arsenal will be greatly improved and the locality beautified.

— The beautiful ST. DABEOC'S HEATH (*Dabeocia polifolia*), abundant in some parts of Ireland, and also an inhabitant of the southern parts of Europe, Mr. M. MOGGIDGE recorded at the last meeting of the Linnean Society as having been found by him at Wallis Downs, north of Bournemouth. Doubtless introduced at this latter locality, it nevertheless appears to have there established a fresh habitat.

— The authorities at Kew will be astonished to hear that TEMPLE BAR, which is now being pulled down, has saved the noble PALM-HOUSE from a great catastrophe. A writer in a local paper has announced it to have been his intention to carry a shell inside the Palm-house at Kew but for the interposition of Temple Bar. He does not say what sort of a shell: his bellicose style naturally leads to the inference that it was to have been a bomb, but that may have been an exaggerated inference and the shell after all nothing more than a figure of speech to illustrate the terrors of his criticisms. Our critic explains himself,

however, further on, and leads us to hope that he has some lucid intervals, for we find that the interposition of the City's historic gateway in preventing the intended disaster to the Palm-house is due to the fact that he has conceived the sublime idea that Kew Gardens is the most fitting place for the re-erection of Temple Bar. Perhaps the Kew officials will scarcely regard this suggestion with more serenity than they would the introduction of the bomb-shell into the Palm-house, but the critic claims to have art, history, and scenic effect in view, and therefore his opinions upon a subject that has so far bothered the Common Council as much as Cleopatra's Needle has bothered our metropolitan ælites may be not unworthy of consideration. Temple Bar may have associated with it great historic deeds, it may have been serviceable in its day in protecting the City from the incursions of the western barbarians, it may even have looked picturesque in the days of the Pretender, but its warmest admirers can hardly claim for it the title of beautiful. Our critic, however, proposes to envelope it in a clothing of climbers and creepers, and thus swathed in living green its architectural charms might well be left to the imagination. It is a curious fact that whilst thousands are being spent to bring an ungainly obelisk of stone over here from Egypt simply because it has great historic associations we are about to pull down one of the oldest and most remarkable street piles of London. Cannot the authorities still keep it in the City and yet make it useful by incorporating it as an entrance into their new fruit and vegetable market?

— "NAN-MU" is the native name of a tree which grows in Yunnan, between 25° and 26° N. lat. Its wood is highly valued by the Chinese nobility for building purposes and for making coffins. Enormous columns of it form the tombs of the Ming dynasty, some 300 years old. Mr. THISELTON DYER exhibited pieces of its wood and leaves at the Linnean Society (December 6), when he stated that while still botanically undetermined, though usually supposed to be Teak, it probably belongs to the Lauraceæ, the leaves closely agreeing with those of *Phebe pallida*.

— All those who had the good fortune to visit the noble GARDEN of the late M. THURET at Antibes, with its rich collections and superb illustrations of succulents and of Australian plants, will rejoice to learn that this garden—thanks to the generosity of M^{me}. LOUISE FOULD—will for the future be devoted to public uses in connection with the Jardin des Plantes at Paris. This is indeed good news; for the contemplation of the dispersal of such a noble collection was grievous indeed.

— Mr. E. J. LOWE, of Nottingham, informs us that he has had this year amongst his CHRYSANTHEMUMS some extraordinary SPORTS, and he has sent us flowers of those from which the following notes are taken:—

E. SANDERSON, a bronze-red sport of George Glenny, having the fine form of Mrs. Dixon and Mrs. George Rundle. The blooms sent, which are only side blooms, were very symmetrical and neat. ANATA, a pure white sport of The Cossack, having very broad petals and only the outside petals curling like a Japanese. We are told this plant has borne some blossoms of immense size, that now before us being very large and full, and of fine form. From its exquisite shape it might be called a show Japanese. LUMEN, a white sport of Florence Nightingale, of very good shape. SCYLLA, an orange-bronze sport of Model of Perfection, with the exquisite form of that variety; very pretty. GERDA, a remarkable yellow sport of the crimson Julia Lagravère; none of the flowers are yet in bloom, but a side bud is sent showing the bright yellow colour. The leaves have the fine Fern-like form of those of the parent. Mr. LOWE remarks that he has about 1000 plants blooming this year; it is nevertheless remarkable that he should have got so many fine sports. He has also coming into bloom and showing colour three other sports; one from George Glenny, with a mixture of red and lemon, the others from Mrs. Rundle, one yellow and the other red. They are a very nice lot, Anata being particularly fine, and E. Sanderson is also likely to be useful variety, the quality being specially good.

— The POISONOUS POWER of the YEW has once more been demonstrated in a somewhat expensive fashion to the owners of the tree that was the cause of offence. An action was entered in the Chesham (Bucks) County Court by a veterinary

surgeon, the owner of a horse, against the Amersham Burial Board, the ostensible owners of a cemetery. The horse was turned out to graze in a meadow adjoining the cemetery, and the branches of the Yew tree projecting over the fence the horse ate of the same and was poisoned. The report specially mentions that it was an unconsecrated cemetery; perhaps the writer imagined that the tree derived its properties from that damnable fact, but that of course would be a matter of opinion. At any rate, the judge, on the ground that the Board should have erected a taller fence, awarded the plaintiff 20 guineas damages. It is a noteworthy fact in this case that the animal ate of the fresh green foliage on the tree, and not of some clippings that were partially decomposed, as has generally proved to be the case in similar circumstances. Very recently a railway porter was prosecuted at the Old Bailey for promoting the death of his wife by obtaining for her some portions of Irish Yew with which to make a decoction to procure abortion, and this, it appeared in the evidence, was obtained also from a burial ground. Both of these instances, however, show how destructive to life the Yew may prove, but it is to be hoped that no active politician will therefore propose that it shall be regarded dangerous to the community and that its future growth be prohibited. The Yew is one of the most ornamental of evergreen trees, and, like the Oak, has many historical associations; probably in the middle ages it was the cause of more deaths in the hands of England's sturdy archers in one year than it has otherwise caused since the introduction of firearms into our armies.

— The PRIVET is a shrub that has berried with great profuseness this year, and the fruit is seen more freely now than the leaves have fallen. We have but recently seen several hedges of this shrub that are kept clipped, and where the leaves have fallen, on the top of which there is literally a mass of the black berries of this well-known plant. There is little that is decorative about them, but great abundance of fruit on other hardy shrubs, than the Holly is thus far demonstrated.

— There is reason to fear the SHRUBBY CALCEOLARIA is just now passing through a season of neglect. Such a marked improvement has been made in the herbaceous type that public attention has been turned to them to the neglect of a very useful section. The herbaceous Calceolarias need attentive treatment during winter and spring; the shrubby varieties, being of a less tender, while they are much more vigorous in constitution, can be wintered in a dry cold frame, with a little protection during severe frosts. They are not nearly so subject to attacks of green-fly, and when attacked do not succumb so readily as their more aristocratic *compères* in the vegetable kingdom. It is a somewhat difficult process to propagate the herbaceous Calceolarias by means of cuttings, but the varieties of the shrubby type can be quickly increased by cuttings. If plants be lifted from the open ground at the end of the summer, or turned out of pots and simply pulled to pieces, the side-shoots, if put in a prepared bed in a cold frame or greenhouse, will take root and make good plants by spring; but, as before observed, there must be protection against frost. Amateur gardeners who are fond of the Calceolaria, but hardly succeed with the herbaceous types (and there is reason to fear the method of improvement now adopted aims too much at increasing the size of the flowers at the expense of constitutional vigour), may be assured that with a little ordinary attention they could grow capital examples for flowering in pots, and, if needed, for exhibition purposes. But it would now be difficult to find a schedule of prizes which contains a class for shrubby Calceolarias.

— All TULIP growers combine in recommending that the bed of choice varieties be covered with mats, or some such covering, during excessively wet, snowy, or frosty weather, taking care, however, to remove the covering on every occasion when drying influences other than frost abound. During the months of December and January the bulbs are not very active in germinating beyond the formation of roots, and as they have no foliage demanding a supply of nutriment little water is required. Then it is the heavy rain falling on the bed at this time, might, and undoubtedly does, work injury on the bulbs. The

best form of covering is formed of iron rods so bent as that the points can be pushed into the soil just without the bed on either side, with mats or Frigi Domo stretched over them, and so fastened towards the ground as that the wind cannot carry the covering away. If the covering has to be kept on for any length of time it is well to open it at each end, tunnel fashion, so that a current of air may pass through and admit some light also. It might be thought by some that by using a covering the surface of the bed would be kept somewhat warm, and the bulbs would be excited to growth sooner than is requisite; but experience teaches that the bed is colder for the covering, especially if the two ends be left open as recommended. The covering (when requisite) serves the purpose of keeping the soil in a moderate state of moisture, and preventing it becoming too dense and heavy during winter; and the soil being preserved light and open the after-growth of the Tulip is thereby favoured by admitting sun and air in spring. These influences are most important, as they stimulate the plants to growth just at a season when such aids are most needed.

— For the last five years the quantity of INDIA-RUBBER EXPORTED FROM PANAMA has been, at first steadily, and of late more rapidly, decreasing. In 1872 the value of the rubber amounted to £400,000, which fell in 1874 to £109,000, and last year the returns showed only £50,000. The scarcity of this valuable article on the Isthmus is due to the system pursued of cutting down the trees to procure the rubber, instead of tapping them, as is done in Brazil. While there has been this falling off in Panama, an increase is recorded from Guayaquil; but this is supposed to be only of a temporary nature, as the practice of cutting down the trees also prevails here, though immense numbers of rubber trees are known to exist in the less explored forests of the interior. The bulk of the rubber is exported to the United States of America, very little finding its way to Europe.

— A new preparation from Eucalyptus, under the name of EUCALYPSINTHE, is announced from France. A Dr. MIERDUE, a colonial surgeon, has, it is stated, succeeded after many experiments and much research in distilling from the leaves a liquor which is at once grateful to the palate, exhilarating, and not only quite harmless but also possesses many useful medical properties. This new beverage is, we learn, being largely made and consumed in Marseilles, and it is thought that within a few months it will become as popular as absinthe and probably to a great extent take its place.

— Some years ago GAY founded a new species of Cork Oak, which he called QUERCUS OCCIDENTALIS, on some specimens which appeared to show that the acorns did not reach maturity until the second year, thus differing in this respect from the true Cork Oak, *Q. Suber*. The late Dr. GOMIZ (*Journal de Sciences Mathem. Physie e Naturees*) fully explains the nature of this phenomenon, and states that it is not peculiar to any particular species of Oak. He says the apparently biennial nature of the acorns is due to the fact that the Cork Oak frequently makes two, or even three, growths in Portugal, so that the acorns of the first shoot appear to be on a previous year's wood, whereas they are really of the same year. These successive shoots during the same season often bear successive crops of acorns, which of course ripen at different periods, but none of them are biennial. The foliage of the Portuguese Oak upon which the supposed new species was founded is annual, when the position of the acorns with respect to the leaves is sufficient to determine, or it is biennial, or even persists three years, according to the weather, habitat, &c.

— Mr. O. VON SEEMEN gives some particulars, in the *Monatsschrift des Vereines zur Beförderung des Gartenbaues*, of a GIGANTIC OAK which is GROWING IN SPRINDLACK PARK in the district of Königsberg, East Prussia. It is, as he says, one of the few glorious remains of the original forests. The main trunk is only about 8 feet high, and its girth breast high nearly 18 feet. It divides into five mighty branches, which again divide and form a spreading crown nearly 90 feet in diameter and 8½ feet high. This tree is said to be, not only for its large dimensions but also for its

fine form, equalled by few others in Germany. From this it would appear that large Oaks are even scarcer in Germany than in England.

— A correspondent of the *Monatsschrift*, writing from JAPAN on the VEGETATION of the country, states that the most striking feature of the herbaceous vegetation is in the variety and beauty of the Orchids. It is impossible to overlook the richness of forms and species. Especially conspicuous is the beautiful *Cypripedium japonicum*, also *C. ringens*, though much less abundant than the former. Among others, he mentions *Cephalanthera falcata*, *C. erecta*, *Epipactis Thunbergii*, various species of *Liparis*, *Habenaria*, *Calanthe*, *Cymbidium*, *Dendrobium*—the three last relatively rare.

— We have already mentioned that Dr. KUNTZE, of Leipzig, has put forward a theory of A PRIMEVAL FRESHWATER SEA. He maintains that the conditions of the stratification of coal can hardly lead us to any other conclusion than that the plants of the period actually grew in the sea, which, as a consequence, must have then consisted of fresh water. The enormous area of some of the coal beds, as the Pittsburgh, which is many hundred square miles in extent, shows that the coal was stratified where the plants grew, and hence the uniformity in the thickness of each layer. And the alternate stratification of coal, limestone, sandstone, &c., as in Nova Scotia, where there is a series of superimposed strata collectively nearly 15,000 feet in thickness, in which there are seventy-six layers of coal, many of them containing perpendicular trunks, proves that it must have proceeded quietly in the sea. If the coal plants inhabited bogs, periodic rising and sinking of the land must have taken place—seventy-six times in succession in this case. Furthermore, each depression and inundation by salt-water would have rendered the soil, argues KUNTZE, unsuitable for vegetation, to say nothing of the reproduction of the same kind of vegetation. He asks whether such conditions were really possible, and contends that his explanation is very simple as opposed to the generally accepted theory. The sea, he goes on to say, was saltless and covered with a luxuriant vegetation, which as it died off was precipitated to the bottom, just as the sphagnum of our bogs are at the present day, and in consequence of the simultaneous deposition of clay became stratified. This aquatic forest was not stationary, but the recurring monsoons drifted them slowly to certain places where there were greater accumulations of coal, whilst in the parts thus bereft of vegetation the deposits of clay were thicker, and hence alternate strata of coal and clay. Only in tranquil bays, where streams had little influence, would thick strata of coal be formed. KUNTZE further argues that the nature and organisation of the plants of the coal measures, as well as the amphibious and marine animals, support his theory, and through upwards of fifty closely-printed pages strives to show that all the phenomena of Nature are more in harmony with this explanation than any other.

— Dr. BOLLE recently communicated to the Horticultural Society of Berlin some interesting particulars of the RELATIVE HARDINESS OF DIFFERENT TREES IN GERMANY. Species of *Carya* which succeed admirably in the Central States of North America suffer from May frosts. *Pterocarya caucasica* survives, but only on dry soil. The Cedar of Lebanon, although it ascends to the snow region in its native country, is not perfectly hardy, whereas the Deciduous Cypress, *Taxodium distichum*, is not injured. The latter inhabits the Southern States of Northern America, and is one of the few instances of plants which will bear a climate colder than that of the country in which they now exist in a wild state. In his useful *Book of Evergreens* JOSIAH HOOPES says, "The Deciduous Cypress, although strictly a Southern tree, thrives admirably in the climate of the Middle States. Its most northern natural limits are the Cypress swamps of Maryland, and the extreme southern part of Delaware. Throughout every portion of the Southern States this tree is found in the low miasmatic swamps, and occasionally very plentifully, especially along the borders of the rivers and larger streams. Indeed, in the Gulf States these Cypress swamps cover thousands of acres, and along the Mississippi River particularly they extend for hundreds of miles." Like the *Arbor-vitæ* this

tree sheds not only its leaves but also its ultimate branchlets, which may possibly explain its hardiness. The Mexican variety, of which a tree girdling 100 feet is said to exist at Chapultepec, is tender. Dr. BOLLE thinks these peculiarities in the constitution of plants are governed by the distribution of heat in the different seasons of the year. One of the members present observed that deciduous shrubs generally withstand frost better than evergreens, because they are at rest in winter, mentioning as examples *Magnolia glauca* and *Larix Kæmpferi*.

— Mr. JOSEPH WHEELER, for fifteen years gardener to the late J. PHILPOT, Esq., of Stamford Hill, and who during that period was a successful exhibitor of stove and greenhouse plants at the Royal Horticultural and Botanical Societies' principal exhibitions, has been appointed gardener to Sir F. H. GOLDSMID, Bart., M.P., Rendcomb Park, Cirencester.—Mr. NEWMAN FULLER, gardener at The Lodge, Oakham, and formerly foreman at Burghley Park, has been appointed gardener to A. R. BOUGHTON KNIGHT, Esq., Downton Castle, Ludlow, Salop.

Home Correspondence.

Cypripedium Roezlii.—Mr. Payne, Belmont, Taunton, in his article on *Cypripedium Roezlii* (*Gardeners' Chronicle*, December 1), writes to know if the peculiarities that he has noticed in the flowers of this beautiful Orchid have been observed by others. To which I answer that the very same facts were noticed in a fine and very healthy plant of *Cypripedium Roezlii* cultivated in my hothouse at Sesto (a country seat of mine not far from Florence). The flowers fall when the succeeding ones begin to expand, and remain in a state of perfection even for as long as a fortnight. I may add that I have observed the same peculiarities (at least in my own hothouses) in *Cypripedium Sedeni*, *C. Pearcei* and *C. longifolium*. As to the reason, I perfectly agree with Mr. Payne. *Marys Barbò Corsi Salviani, Florence.*

— Mr. Payne will find that the flowers of *C. longifolium*, *C. Fairrieanum*, *C. Schlimii*, and *C. Sedeni* fall quite as readily as *C. Roezlii*, but keep, as Mr. Payne truly says, a fortnight quite fresh. I cannot agree with him that expanded blossoms fall off to make room for their successors, as he will observe the last flower falls as readily as the first. *F. Newman.*

Desfontainea spinosa (p. 695).—This may be called a hardy bush, but a difficult one to grow. I once saw a magnificent specimen near Swansea. I have a specimen which is growing well, but has not yet flowered. I think it should be planted in a cool corner, where the wind will not reach it much; mine is under a north wall, and that position seems to suit it. *Henry N. Ellacombe, Bolton Vicarage.*

— In response to your desire for more particulars in proof of the hardiness of this plant, I can only say that my plant at Broughty Ferry is within $\frac{1}{2}$ a mile of the sea, but at an elevation of 200 feet. It is sheltered from the sea breeze by trees and shrubs between; still it is quite exposed to all winds, and particularly to the north. A *Garrya*, golden *Euonymus*, *Osmanthus*, *Cryptomeria elegans*, *Erica vagans*, and *Daphne collina* are round about it; it still (December 4) has flowers on it. *D. U.*

Thompson's Gardeners' Assistant.—I note with regret that Messrs. Blackie & Son do not feel disposed to issue any cheaper edition of this work as I suggested they might do at p. 685. That it can be purchased in thirteen parts at 2s. 6d. each, and the payments be so spread over a lengthened period, is but slight accommodation. This method of taking finished books out in monthly parts is an expensive process—the dearest and most unsatisfactory way of buying books. The cost of the thirteen parts at 2s. 6d. is equal to 32s. 6d., to which must be added the cost of binding, say 4s. 6d., making a total cost of 37s. instead of 35s., the published price. These canvassing booksellers, with their beautifully got up "specimen copies," full of pretty pictures, and their easy accommodation—only 2s. 6d. a month, are a great nuisance to gardening society, almost as bad as the tea and tallyman. [Quite as bad most gardeners will say. EDS.]. Many a young gardener to my knowledge has been so

induced to "take in" this work at 2s. 6d., and that work at 1s., and ultimately obliged to discontinue them or to sell them in fragments to his more fortunate companions for little or nothing. I again repeat, that these pictures are of no practical value to under gardeners, the principal readers of the *Gardeners' Assistant*, and that they ought not to be called upon to pay for them. *A. F. B.*

Osage Orange.—If your correspondent, Mr. Haig, alludes to *Maclura aurantica*, I may say that we have here a specimen of this plant 15 or 16 feet high. It has never borne fruit or blossom. *G., Bath, Dec. 7.*

— In answer to Mr. J. R. Haig's inquiry (p. 723), I can inform him that this plant (*Maclura aurantica*) is perfectly hardy, and grows very rapidly; I have grown it for many years in an exposed situation. I suppose the reason why it has not been more used as a hedge plant is the difficulty of increasing it, either by seeds or cuttings, but I have been told that it can be propagated freely by root-cuttings. I have never seen its curious fruit, which are described as Oranges of 7 or 8 lb. in weight. *Henry N. Ellacombe, Bolton Vicarage.*

The National Rose Society.—In your report of the annual meeting of this Society you mention that I resigned the office of honorary secretary. As very few of the members were present, I should like those absent to know why I so resigned a post to which I was only elected last September. When Mr. Charles Turner and other gentlemen urged my acceptance of the post Mr. D'Ombrain opposed my appointment with all the force he could. I accepted the office most reluctantly, as I saw that my appointment was most unacceptable to Mr. D'Ombrain. But being appointed I naturally supposed that my office would not be honorary both in work as well as pay, and that I should have some say in the matters of the Society. Mr. D'Ombrain, however, appears to have thought otherwise, for he settled on the agenda for the public meeting, and sent out the notices with my name appended without even consulting me. On my writing to expostulate with him on his want of courtesy (to say the very least) he never answered my letter. I felt, therefore, that I could not work with a man who treated me like this, and so tendered my resignation. *John B. M. Cann, Monkton Wyld, Dec. 10.* [This surely could not be the "annual meeting" at all, as we know at least of some members who had no notice of it. EDS.].

Ageratum.—All who have any use for *Ageratum* will readily admit their great value and the superiority of the new varieties over the old Mexicanum. It is surprising the strides that have been made since this was sent out, both in dwarfness and freedom of flowering as well as in the colours of the flowers. When all the sorts are planted side by side it is seen that Countess of Stair and Lady Jane are decidedly in advance of the others, and the latter in particular, for all purposes in which the *Ageratum* is used. Of the last-named variety I send you a handful of flowers, to show their value for decoration even at this dull season. Could some one devise some simple method of destroying their present odour, and cause a more agreeable one to be imparted, this variety would at once become of greater value for bouquets, for its colour is exceedingly pretty. With us it blooms abundantly, and far surpasses all other blue varieties. Although I have anxiously and carefully tried all the light varieties yet sent out, I cannot recommend either for permanent bedding, although Snowflake is decidedly the best, and if planted in shady, wet situations, it answers their purpose very well. *H. Cannell, Jun., Swanley.*

The Mealy Bug.—This is certainly one of the worst enemies a gardener has to contend against, and unfortunately it appears to be more general, especially among stove plants, now than formerly, owing probably to the more extended culture of plants, and from a want of that constant watchfulness over plants fresh introduced among collections that is absolutely necessary in order to guard against it. If a place is clear of it watchfulness over plants fresh brought in from the nurseries should be observed. Stamping it out is the most effectual way of preventing its increase by burying any plants that have any mealy-bug. Of course plants can be cleaned, but great care and watchfulness are always necessary afterwards in case it should show itself. Nurserymen should be very careful in sending plants out, to see they are free from this pest. Young plants should always be put into quarantine after they are bought in until one is certain they are clean. Sales of plants sometimes spread this pest. A collection of plants that have it badly is sold by auction, and the plants go into several places, carrying mealy-bug with them; the plants, having undergone a thorough washing a few days previous to the sale, look bright and clean to the inexperienced, and are often put among the general stock, the presence of mealy-bug not being suspected

until it has spread to many of the adjoining plants. It is a very difficult task to get rid of mealy-bug when once it is established among a collection of plants, also in vinerias and peacheries. There is nothing but washing and constant watchfulness to keep it down; perseverance in doing this, and doing it well and carefully, will keep it down. *M. S.*

Sutton's Magnum Bonum Potato.—As a grower of Messrs. Sutton & Sons' Magnum Bonum Potato, I can fully endorse all that your correspondents have stated in praise of this variety, in recent numbers of your paper. This last season has been the worst for disease that I have experienced since the fatal year 1846. The Magnum Bonum is, however, quite free from disease, the many other kinds growing alongside of it are all but wholly gone. It is, moreover, a great yielder and a good "cooker," and if it could be plentifully supplied to the Potato growers, would indeed be a great boon to them. The great fear is lest spurious stocks should be sent into cultivation to meet the great demand for this Potato. I have heard of the Belgian Kidney having been supplied for it. But if growers will purchase upon the general market they must always be liable to such disappointments. A neighbour of my own last spring planted some acres with what he bought at a great price as "Snowflake." When he found the tops still green after my own crop of them was ripe, he asked me to inspect them. On doing so I found a very true stock of "Bressee's Prolific" had been supplied to him, which does not ripen so early as Snowflake by three weeks. *John Fryer, Chatteris.*

Duke of Buccleuch Grape.—This Grape has now been sufficiently long in cultivation to enable fruit growers to form a tolerably correct estimate of its merits or demerits. Like your correspondent, "J. McC," my opinion of it does not improve with my longer acquaintance. Nearly four years ago, when planting two vinerias, I ordered four plants of Duke of Buccleuch, two plants for each house; but such was the demand for it (I presume) that the parties who supplied the Vines could only send me three plants, and these (though not very strong) at a rather high price. They offered to send me a small plant to make up the number, but I declined having it. The borders were made entirely new, and the whole of the Vines were planted at the same time, the Duke of Buccleuch having a favourable place among them. The progress of the Vines has been very satisfactory, and all except the Black Morocco and the Duke of Buccleuch bore a nice crop of fruit this year, and some nice Grapes last year also. One plant of the Duke has not yet showed anything that could be called a bunch of Grapes, the other two had this season three miserable bunches between them. The few berries swelled to a large size and coloured well, but just when nearly fit for use became badly spotted. Two of the plants I have recently cut away, on the other I have inarched Foster's White Seedling, and when this makes a cane I intend cutting away the remaining plant of Duke of Buccleuch, unless it shows very different next year, but I must candidly say I have a very poor opinion of it, as I consider it had every chance of doing well. If it be all that it is said to be, why has it not been exhibited more frequently at the great fruit shows? I hope many of your correspondents will give their candid opinion of this Grape. If it be not worth growing, as I believe, the sooner the public is made aware of the matter the better. The failure of three Vines, bought at a high price, is no small matter after patiently waiting four years to see how they would turn out. Unfortunately, there have been too many new Grapes put into commerce of late years—some of them ushered in with a great flourish of trumpets. Testimonials have been so injudiciously given that gardeners place no value upon them. When people plant three or four new Grape Vines that turn out unsatisfactory, and three or four of the other Vines in the house do not prove true to name, it is very disappointing. The Duke of Buccleuch has put a damper on new Grapes, and yet I doubt if it will prevent people buying new Grapes—novelty and variety are so tempting. *M. S.*

Shade Loving Plants.—It affords pleasure to be able to advance information respecting those lovely flowers that cheer us in our avocation, and perhaps, as "Trowel" says, it may tend to some good. *Allium Moly*, known also as *Luteum flavum*, is a free-growing border plant, has umbels of pretty yellow flowers in early summer, increases rapidly by offsets, continues in bloom for a length of time, is at home anywhere, and not nearly so disagreeable as some others of the family. *Allium narcissiforme paradoxum* and *azureum* are desirable kinds. *Alströmérias* are allied to the *Amaryllids*, and are one of the most beautiful of all the races of hardy plants. *A. aurea* is perfectly wild with me in a moist shady border, and when in bloom is the admiration of all that see it. *Gagea lutea*, along with *Ornithogalum umbellatum*, give us a fine display

under a Weeping Ash on the grass. *O. nutans narbonense* and *fimbriatum* are in partial shade. My *Caltha* is planted in a prepared moist place surrounded by burrs from the brickyard, not directly under the trees, but still shaded; it does remarkably well. I have had *Lilium martagon*, *candidum*, *chalcidonicum*, and other hardy kinds planted here and there by the walk-sides in the grass in partial shade for nearly twenty years, and when in bloom they afford us much pleasure. There are hardy *Oxalids* for a damp shady bank, and amongst them our own *Oxalis acetosella* is a charming plant in the spring. For less shaded places *Oxalis floribunda* and *Bowiei* with others may be named, they will also bear full exposure. *Veratrum nigrum* is a rather tall-growing autumn-flowering plant that does well in the shade with us. *Campanula latifolia* is a great favourite, and often found in shady woods. *Aconitum Napellus* succeeds well with us in the grass in shady places. *Polygonum Bistorta* in moist places under trees is quite at home. *Andromeda axillaris* is a fine evergreen in the shade, and especially fine when in bloom. The three colours of *Daphne Mezereum* should have a place in all shaded borders; no plants are more beautiful than those when showing their lovely flowers through the snow. We find a useful plant as a climber in *Solanum dulcamara*, and *Lysimachia vulgaris* and *ciliata* are at home in partial shade. *Geranium nodosum*, *Saxifraga geum* and *americana*, *Honesty*, *Lunaria biennis* and *Dame's Violet*, *Hesperis matronalis*, we have among the trees in abundance, with other plants that do well in the shade. I would advise "Trowel" to let the *Aquilegias* remain as they are till early spring, and then, if convenient, pot them two or three in a 3-inch pot, place them in a cold pit or frame if at liberty, otherwise prepare a place on a sheltered border, and prick them out 2 inches apart; afford them shelter until they are established, and then plant them out in good soil where they are intended to remain. *Constant Reader.*

The Sweet Bay: a Harvest for the Birds.—I have enclosed a small bit of this very ornamental tree, to show you how thickly they are loaded with berries. The tree that I took this bit from stands on the lawn here, and measures 41 feet in height and 30 in diameter. It is covered with berries more or less in the same manner as the bit I have sent you. The blackbirds and thrushes have commenced to feed on the berries, and in a month's time they will have cleared the trees. *D. S., Apley House, Ryde, Isle of Wight.*

Waterproof Card Labels.—Having tried the waterproof card labels for several months I have come to the conclusion that they will not last properly more than twelve months, but they are a step in the right direction, and, when thoroughly mastered, will be hailed with great satisfaction by thousands of gardeners and nurserymen. I have scrubbed them and rubbed them in hot water and cold water, but failed to move the ink. You will see by the labels enclosed that they lose their colour, and the brown labels turn rusty where inked, more so than the blue ones. The long label has been in use for nine months and the heart-shaped one for three months, and in each case the best black ink only was used. *F. Newman, Gr., Sunbury House, Tunbridge Wells.*

The Varying Qualities of Pears.—Is there any reason known for Pears varying so much in flavour from year to year? Pears grown in orchard-houses certainly do so vary, and I do not think it can be a question either of sun or of over-cropping. Most of our trees have been in pots for more than twenty-two years; they are turned out of the house when the fruit is safe from frost, and they always have the same treatment. Every year some sorts have excellent fruit, but not the same sorts; for instance, this year *Easter Beurré*, which with us is uncertain in flavour, was really fine, though ripe too early, while *Joséphine de Malines*, usually excellent, was poor, though its flesh had the right, warm colour. *Winter Nelis* was only fair, and had to be eaten quickly, as it soon decayed; *Glou Morceau* was excellent; *Doyné du Comice* is always so very good that the variations in it are less marked. A Pear not usually very much thought of, *Triomphe de Jodoigne*, is often very good with us, and was this year excellent. *Maréchal de la Cour* was very poor. I could give more examples, but the above are probably sufficient. It would be a comfort to know what other growers, especially those with orchard-houses, have found. *George F. Wilson, Heatherbank, Weybridge.*

Calanthe Veitchii.—This is just now in very fine flower in the Orchid-houses of Wm. Leech, Esq., Oakley, Fallowfield, near Manchester. There are about a dozen pots of it, and quite sufficient to give the houses a fine tinge of red at this dull season. There seems to be two distinct varieties of this Orchid in cultivation, one a good deal deeper in colour than the other, and Mr. Swan has managed to get a fine

stock of the best sort. The pots are not large which he grows them in, but the bulbs are strong, the spikes numerous, and the flowers and buds upon the spike numbering from thirty to forty. The bulbs are closely planted in the pots, appearing as if they were just the natural increase of one single bulb through the course of a few seasons. Besides this *Calanthe* being in extra good order at the above place, the other varieties of *C. vestita* are also in good form, fine spikes of *Saccolabium giganteum*, *Odontoglossum Alexandræ*, *Lælia anceps*, and many others that would interest the Orchid fancier more particularly than an ordinary visitor. A very nice block of *Sophronites grandiflora* was also to be seen. This though not a new thing is very beautiful, it is such a fine deep red colour. All the Orchids appeared to be in very good health, and the houses nice and clean. Respecting the cultivation you have it detailed fully in your journal from time to time. *R. M.*

Calanthes at Riddings House.—We have bulbs of *Calanthe Veitchii* 8 inches in circumference and 11 inches in length, producing three spikes from one bulb, and fifty flowers on one spike, together with other varieties, such as *C. vestita*, *C. vestita rubra (oculata)*, which have been flowering since October, and are now a perfect boon to us. *Dendrobium nobile* is flowering to perfection; *Cypripediums* and *Zygopetalums* are in full beauty, and producing in combination a charming effect. *B. E.*

Chrysanthemum Sports.—A pretty and interesting sport has occurred here with a plant of the Golden Cedo Nulli *Chrysanthemum*. It is a trained specimen about 10 feet in circumference, and has about one-fourth of its flowers white—or more properly bluish—a few of them being parti-coloured (blush and yellow). I enclose you a few flowers, all taken off the plant. *J. Wilkes, The Gardens, Park House, Cheadle.*

Pronunciation of Latin Plant Names.—Although Mr. R. C. Pryor has never met my request that he would act up to his voluntarily expressed intention to enlighten me as to the words *petiote* and *zizanon*, he probably considers his last letter (p. 725) entitled to some sort of notice at my hands. I certainly had no idea till I read this very singular composition that "petiole" was a Latin plant name. But it is never too late to learn, and I am always thankful for original information. The pronunciation of petiole has nothing whatever to do with the subject in hand. I may observe, however, that the best modern English dictionaries follow the low Latin *pētīōlus*, and give it as *pēt-ī-ole*. Contrariwise, it is but courteous to add that not long ago a very high class London professor of botany, a distinguished author and lecturer, pronounced this word, during conversation with me, as *peesh-ole*. What can Mr. Pryor mean by saying that it is as easy and correct to pronounce the *p* in *psamma* as it is to do so in *psychology*? It may be as "easy," just as it would be quite as easy to call the writer who says so Mr. P—ryor as Mr. Pryor; but, the *p* in *psychology* is *not* sounded. It is never sounded, any more than in *psalm*, *psalmody*, *psalter*, *pseudonym*, *pslaw*, &c. Possibly enough, the initial *p* in *Psyche*, *psamma*, &c., had, 2000 years ago, some kind of phonetic value, and represented something of which the record is lost, unless in Theocritus, but in modern England it is invariably dropped, retaining its place in the spelling purely for etymological reasons. Every dictionary and every form of cultivated usage proves what I say. I admit that it is "hardly necessary" for Mr. Pryor to "add anything" in reference to *Gladiolus*; indeed, I think it is quite unnecessary, and commend his prudence in abstaining from the enterprise. It may be well for him, should he ever approach the subject, to consider whether, if there be any value in comparison and analogy, the following classical words should be ignored. They are all of them diminutives, corresponding with *Gladiolus*, from *gladius*, and the pronunciations are those given in the dictionaries:—*Calceolus*, *aureolus*, *filolus*, *radolus*, *modiolus*, *malleolus*. At his leisure also he may compare the congregate *vi'ola* and *iov*. To the above list of words, properly classical, may be added numerous modern botanical names:—*Struthiola*, *Seri'ola*, *Mede'ola*, *Grati'ola*, *Rhodi'ola*, *Scari'ola*, &c., the pronunciation of which is given in London as indicated. Of course, analogy is no proof, and there are exceptions to all rules, but in the present case it really seems as if the weight of illustration goes in favour of *Gladiolus*. I do not pretend or presume to decide the question. I am acting simply as counsel for my client. I hope the readers of the *Gardeners' Chronicle* appreciate and duly admire the delicate scholarship shown by Mr. Pryor in detecting the obvious printer's error of diphthong for dipthong. On p. 615 the word is spelt correctly, and it is only in its later occurrence that the compositor has omitted the *h*. To have pointed out the error on p. 615 of *Anætochilus* for *Anectochilus*,

and to have told us what is the proper *fabrio* and the essential meaning of the word, so often misconceived, would have shown some really exact knowledge of orthography and etymology, and have done some really good service. Why did Mr. Pryor let his opportunity go by? *Quien sibi? Leo Grindon, Manchester.*

Omphalodes Lucille.^{*}—A very charming rock plant, not yet known as widely as its merits demand. The general habit is sufficiently well shown in the accompanying illustration (fig. 146), taken from a plant in Mr. Parker's nursery at Tooting. The leaves are glaucous, the flowers are those of a Forget-me-not on a large scale, and present, as stated in the *Botanical Magazine*, all shades of colour from pale pink, purple, to azure. It is a native of the mountains of Asia Minor, but is quite hardy. Those who are interested in the architectural arrangements of plants, if we may so term them, may notice that while in some cases the flower-stalks spring direct from the axil of the leaves, in other cases they spring from the main stem some distance above the leaf. This is a peculiarity often observed in the Borage family, and it has been the exciting cause of a very large amount of observation and record on the part of

position to contradict emphatically the statement of "G." that it is "impossible to drive the heat" down into the Vine-border to a depth of 1 foot or eighteen inches by the aid of heating materials. An early Vine-border here has been repeatedly tested during winter and spring, and the temperature about 6 inches under the surface was found to stand off and on about 68°, 1 foot under at 65° or thereabout, and 18 inches down at 60°. These temperatures, however, varied according to the weather, which regulated the heat of the fermenting materials—cold weather with wind cooling the latter down to 70° sometimes, while in mild weather it would be 80°, but not often above that. From 75° to 80° was what we tried to keep the litter at by periodical turnings; and additions, and some 18 inches of materials was required for that purpose. Now these are facts which any one may prove for themselves, and I ask "G." in return, if it be too much trouble for him to note a thermometer daily, to furnish us with the temperature of his borders for three consecutive days in each month, which I think he cannot reasonably refuse to do. He asks for proof of better Grapes grown with the aid of fermenting materials than his friends—whom he does not name—produce without them. I shall be silent about my own practice, but I will give the name of one whose successful

that the heat is of no service to the Vines any more than it would be to early Peach borders. "D. M., Dunrobin," gives us the mean temperature of the soil for North and South Scotland, and concludes he has arrived at a fair average for all Scotland. Now the situation of the gardens at Thirlestane Castle is a very cold one, none more so between Edinburgh and the Tweed—so cold indeed that neither Peach nor Apricot will thrive outdoors, and yet good Grapes were cut and Peaches gathered in May, in my time, and that without any heat whatever to the borders or roots. Hard facts these. In the winter of 1852 and 1853 the present gardener then foreman, Mr. Whitton, wrote me that they had registered 47° of frost, Fahr., or 15° below zero, which would render cold and useless any fermenting materials. I may say in conclusion that the same Vines had been forced annually for many years before my time (1851 and 1852), and showed no signs of weakness, &c. *W. A., Ford Manor, Lingfield, Surrey.*

— In order to make an attack with some hope of success upon any old established system of doubtful utility, it is absolutely necessary that the assailant be bold and fearless in assertion, and prepared to support it with sound evidence. With this conviction I venture to uphold the opinion of another corr-

FIG. 146.—OMPHALODES LUCILLE. FLOWERS BLUE AND PINK.

botanists. One explanation is, that the flower-stalk when between the leaves and not axillary to them is adherent to the main stem for some distance above the leaf, so that instead of coming off in the axil of the leaf next below it, it remains adherent to the main stem for some distance. In the plant before us we found this view borne out by the position and arrangement of the vessels of the stem and of the flower-stalk, which, on a transverse cut being made at various heights, exhibited the vessels thus arranged— \odot , the large circle indicating the vessels of the stem, the smaller one that of the flower-stalk. In other Borages, however, the arrangement is different, but these are structural details for which lovers of rock plants in general will not thank us. We are sure we shall earn their gratitude by calling their attention to the beauty and long continuance of the flowers. *M.*

Covering Vine Borders.—I am sorry to see that "G." declines to furnish the temperatures of his Vine-borders. If my practice had been called in question I should have been only too glad, I think, to have vouched for it by the readiest means. I do not consider it too much "trouble" to look after the temperatures of our Vine-borders any more than the temperature of the vineries, and I am therefore in a

practice extends over some forty years, and whom everybody knows—Mr. Henderson, of Cole Orton Hall, who has recorded that he attributes much of his success to the use of fermenting materials, "thereby raising a gentle heat," and "drawing the roots to the surface," as he puts it, and which is all that others who adopt the practice aim at. Mr. Henderson has never changed his views, and his success as a Grape grower has been proved on many an exhibition table, and has often enough been commented on in these pages. Now I call this a very respectable "fact" indeed, and I shall be curious to see how "G." will deal with it, seeing he has predicted such disastrous results to attend the use of "heating materials," and I would ask him to match it if he can. I see, also, that your excellent correspondent, Mr. Coleman, of Eastnor, advised your readers about a fortnight ago to "have a good supply of thoroughly worked and sweetened Oak leaves and short stable manure always in readiness for covering up outside borders of early houses." Mr. Coleman's success is well attested, and if I am not mistaken, he has been going at it for a considerable while, and with pretty old Vines. Will "G." venture to affirm that the result of either the above gentlemen's practice has been, or is, "a large number of shanked berries," bad colour, and other evils described by him? *S. W. the Second.*

— In common with some of your correspondents I have never seen any advantage in fermenting materials, have rarely seen them used, and satisfied myself

spontaneous, that covering early Vine borders with fermenting material is a waste of labour and material in most cases. And I would add that in some instances it is a positive blunder, and is therefore injurious. To support my assertion it is necessary for me to go back for ten years, when with the vineries now under my charge I followed the common custom of covering with leaves and long dry litter an outside border, about the beginning of November, and using fermenting material of a like nature between 2 and 3 feet thick for inside border, when commencing to force the Vines early in January. This course I followed for two or three years, with results not so satisfactory as I expected. I accordingly gave up the use of any such material inside the house, but continued covering outside for three years longer, but never having Grapes earlier than July, and not so fine in flavour as they ought to be even then. Eventually I gave up covering the borders all together, having reduced it to only a foot of leaves, year by year. I resolved to change my system of management, which is now to cover with well rotted manure to a depth of 3 or 4 inches before frost sets in in autumn, and allow it to remain till April, when it is broken up with forks and any rough stuff cleared off. The Vines are allowed to start easily the second week in January, the house is shut up, and the pipes made slightly warm, the temperature of the house about 50°, but allowing it to fluctuate a good deal with the outside temperature until the Vines are all fairly and

^{*} *Omphalodes Lucille*, Boissier, *Diagn. et Flor. Orient.*, vol. iv., p. 267; Jamb. et Spach, *Ill.*, tab. 366; *Bot. Mag.*, t. 177.

equally broken. It is then increased and kept with more regularity. We have now for three years past cut Grapes in May, the first bunches being generally sent to London dinner parties, and, I am told, are very much appreciated. I may also mention that shanking, to which the fruit was very much subject in former years, is scarcely any source of anxiety to us now. I make no claim to being a Grape grower of any repute, having never exhibited anything in my life, but I enjoy the pleasure of knowing that my employer and his guests consider my productions very creditable. I began my remarks with one assertion, I venture to finish with another—that if some of our renowned men in Grape cultivation could be persuaded to forego covering early Vine borders, their early summer exhibits would bear better comparison with their autumn displays. *Scotia.*

Wild Rice.—I should recommend your correspondent Mr. J. R. Haig to try the method of importing seed which has been so successfully adopted for Palms, Water Lilies, &c. This is to embed the seeds in slightly moist adhesive earth, and place the whole in a tin canister, made air-tight to prevent evaporation. On receiving the canister at once put it into water, to soften the earth and germinate the seeds. *W. B. Hensley.*

Protecting Wall Fruit Trees.—My experience of the past season leads me to think that nothing short of covering entirely with glass can prove really effectual in protecting our wall trees. I have in vain looked for something that could be depended upon, but up to the present have failed. I have a wall 70 yards long and 12 feet high with a spar or eave projecting 18 inches and fitted with O.G. spouting. The number of trees on the wall is fifteen, all Apricots, which nearly cover the entire space. The south aspect is protected from N.W. to S.E. by buildings, and is considered in ordinary seasons to be somewhat proof against frosts; and the failure of the past season, I am confident, must not be attributed to frost at all, as I did not lose a blossom by it. The real cause was the wet and sunless weather. The rains beat on them all the winter, and they had no chance of getting dry. The buds swelled but could not burst, and dropped off in that state, while the wood might as well have done so, for it is all dead and nothing remains but the bare branches. Some years since this wall was fitted up with canvas stretched from the eaves suspended on poles in a slanting position to the surface of the border, which would have been better than nothing if the wind did not blow, but in windy weather such a breadth of canvas could not be kept in its position, and after costing £20 it was abandoned. Glass coping might be a safeguard in some seasons, but if it cost half as much to fit up as it would cost to cover the whole space it would not, I think, be saving anything in the end, as in the case of the coping. If netting had to be suspended in front the expense and extra trouble would soon cost as much as all the glass. And again, as regards netting, except a double thickness is used in case of frost, it is of no use, and in dull weather the trees would welcome what sun they could get. I have seen trees shaded during early spring with netting and canvas, which, when it has been removed, has caused the sun to curl the leaves, and the trees to look the picture of wretchedness all summer. Altogether there seems to be a difficulty which I am afraid will find no remedy where we have to depend on outside cultivation of our tender fruits in our variable climate. *R. C. E.*

Vinca acutiloba.—This pretty Italian Periwinkle has long been an object of attraction in the nurseries of Messrs. Backhouse & Son, of York, where it has been in flower for about three months. The blossoms for the first two months were pale lilac in colour, while, singular to say, the flowers are now quite white, resembling the flowers of *Jasminum grandiflorum*, but about half as large again. There is a fine stock of it in the York Nurseries in excellent health. Judging from the quantity of buds on the plants yet unexpanded they will continue to flower for some weeks to come. It is a most valuable and useful addition to our hardy autumnal border flowers. *B. P., Holgate, York.*

Cinerarias and the Frost.—In spite of what Mr. Brotherton says I should advise all amateur growers of the *Cineraria* (gardeners can hardly want advice in the matter) to keep their plants from frost as effectively as possible. Sailing too close to the wind may lead to a disaster, and, therefore, it is best to be on a safe tack. The old story of the gentleman who wanted a coachman, and put to each candidate the query, "How near could he drive to a precipice without tumbling the carriage over?" is very appropriate in this case. Some like your correspondent could venture to drive within an inch of the edge, but the gentleman wisely preferred the Irishman who exclaimed, "Och, by my faith, yer honner, I'd keep as far from it as possible." The *Cineraria*, whatever

may be said, is one of the tenderest of greenhouse plants, and although it delights and thrives best in a cool temperature it has a decided horror of frost, and is killed, or at least much injured, where *Primulas* and *Calceolarias* escape unhurt. The tenderest part of the plant is the leading point or points; if it has begun to throw out flowering stems let these be once nipped, even though the foliage be little injured, and the plant is at once rendered valueless. Cold frames suit the *Cineraria* admirably when only a few degrees of frost prevail, as the covering of a mat will exclude this; but if the temperature lowers to 10° or 12°, then, unless there are heating materials in the frame, the plants will soon be in a bad way. With the danger from frost on the one hand and the pest of green-fly evolved by fire-heat on the other, the cultivator of the *Cineraria* is somewhat tried. In the latter case a little tobacco paper may soon settle the enemy, but for the former there is no antidote. If erring at all it is best to err on the safe side by having fire-heat in severe frost. *A. D.*

—Some correspondence has lately taken place in your columns as to the hardness of the *Cineraria*, one correspondent affirming that it will stand frost with impunity if thawed in darkness afterwards. My experience leads me to think otherwise, for if the plants are in a forward state, frost, which has scarcely perceptibly touched the foliage, will invariably turn the breaks blind. On the other hand, I have no hesitation in saying that if the plants have been grown as advised at p. 466—namely, in a cold frame, with abundance of air, much cleaner, healthier, and more robust plants will be the result than if coddled in houses with plants which could not with safety be subjected to so low a temperature. I always grow mine in a cold frame, on a bed of ashes, subjecting them to plenty of air, and never at any time while there does green-fly attack them. With plenty of covering material in the shape of mats and litter I have no fear of 15° or 16° of frost (outside) but should not like to entrust them to the tender mercies of 2° or 3° inside the frame. One rule I always observe, that is, when signs of frost appear to see the covering materials put on myself, as it is not so much the quantity as the way it is put on that keeps all snug. *J. Wilkes, Park House Gardens, Cheddle.*

The Mossy Saxifrage as a Decorative Winter Plant.—I am under the impression that it requires a more extended familiarity with these pretty plants to render them as popular as they deserve to be, and feel certain the time is not very distant when winter bedding with them will be general. Though handsome at all times, it is not in summer, when in flower, that they appear at the best, being mostly white, and that not always of the purest, though there are certainly exceptions in such forms as *S. cotyledon* (pyramidalis), which is a gem, but on the whole it is the conformation and habit of these plants when not in flower that adds to their beauty. It is in the dreary months of winter that they appear at the best. I grow somewhere about 130 species of Saxifrages, but am limiting these remarks to the "mossy" section. Of these I have about forty of every possible shade of green, from the very dark green of *S. virens* to the silvery green of *pedata*. They range in height from 2 inches to 6 inches, and grow all through the winter the most charming masses of verdure imaginable—little fairy emerald mountains, and one variety, *S. islandica* (*caespitosa*), is so truly beautiful that one feels tempted to cover it with bell-glasses, or take it indoors. Beds of early bulbs should always be dotted over with these plants, and I do not hesitate to affirm that any person who thoroughly understood them would with their aid be able to make a parterre as interesting all through the winter as the highest style of bedding would be in summer, to say nothing of the transition from a blaze of high colour to masses of lovely green; and I am not certain that even through the whole of summer the highest style of decorative gardening would not be greatly enhanced by a liberal use of the green of these lovely plants. *Thomas Williams, Ormskirk.*

Charred Bones.—A correspondent writes to us saying that he can command quantities of charred bones; but he does not know what they are good for, and wishes that we would tell him what would be the best way to use them through the medium of the *Gardeners' Chronicle*, as a query on this same subject appeared there some time ago which no one has, as yet, answered. After carefully testing these charred bones we have come to the conclusion that, as they are, they are of very little use as a manurial agent, as they are in a state of insolubility in the first place, and in the second, from their being charred, they are much more likely to remain in the soil, when so applied, "in a fine state of preservation," than they are to decay, and of course so long as they remain in that state they can yield little or no plant food. Being denser they do not act so effectually as absorbents of manurial matter (ammonia, &c.) as common

charcoal when mixed in the soil for that purpose; but they possess the property of an absorbent sufficiently to make them of real value for the purposes for which charcoal is generally employed by gardeners in pots or borders, &c. In their present state, then, they are of rather less value than common charcoal; but with little trouble, and at a trifling expense, they might be made into a very valuable manure for many garden crops, viz., superphosphate. The first process requires to be their reduction to ashes, and in that state even they would form a valuable manure, doubly so in soils where there is reason to believe that phosphoric acid is deficient, as it generally is in very sandy soils, &c., or applied to crops which generally exhaust the land as regards this compound, such as Peas, &c. But to get the full benefit of it the same season it is applied, it will be better to convert into the superphosphate of lime by the addition of sulphuric acid (vitriol). This sulphuric acid is to many crops as great a necessity as is the phosphoric acid which is contained in the bones, but its chief use in the present instance is to prepare the bone-ash for assimilation by the crop to which it is applied. Perhaps the best way to effect this would be to lay down a heap of the ash on the ground or on a brick or cement, or clay floor, under cover, and to carefully pour on the acid, mixing thoroughly from the centre outwards as in mixing mortar with an old spade or shovel, keeping the tools and everything else as clear of the acid as possible. We recommend mixing it in a heap on the floor or ground, because if mixed in an iron boiler, or such similar place, the acid would dissolve the iron whenever it came in contact with it, and for the same reason we recommend an old spade or shovel—the acid would spoil a new one, if used. A glass or glazed earthenware vessel would be a good thing for the purpose, as sulphuric acid has no action on glass. Enough acid should be put in to make the whole heap uniformly moist. After this has been accomplished the whole should be allowed to stand a few days to allow it to be thoroughly digested. It will then be superphosphate, and you can be sure that it is not adulterated superphosphate, a thing not unknown. Should the mass, after standing, not be in a condition to spread evenly it should be rendered dry and pulverulent by being mixed with wood ashes or quicklime, or any dry powdery material—preferring wood ashes as they would be the means of adding potash, soda, &c., which would enhance the value of the mixture. Such a compound would prove a first-rate manure if mixed with nitrate of soda, and applied in spring to Potatoes, the Brassica tribe, and indeed anything. For a top-dressing to old lawns or old pasture lands nothing could be better. *A. H.*

Lynum trigynum.—In some notes recently on plants in bloom at Kew, you spoke of this fine old plant in favourable terms, but you have not said a word too much in its favour. I think it deserves to be better known, considering the fine display it makes, how accommodating it is, and how coolly it is grown. Every one desiring a showy yellow-flowered plant to bloom through the winter ought to grow it. Grown in 32's or 48's they make very useful plants for vases and baskets for house decoration, as I have found them stand a long time, and especially if grown in a temperature of about 50° at night and close to the glass, and put for a few days at the coldest end of the stove previous to going to the conservatory. Red-spider is its greatest enemy, but this is easily overcome by growing the plants in a moist pit through the summer, and syringing them every day. They may be had in bloom a long time by growing a lot and putting them into the stove in batches through the autumn. *H. G. C. 7.*

The Rival Ivies.—Is not the above heading a misnomer? I don't think there need be any rivalry between the common and Irish Ivies. For covering old ruins, stone pillars, or old trees I don't think the common Ivy need fear a rival. We have it in the above positions here, and it looks as if at home, but on the walls of the mansion-house, alongside of the palmeto Irish, it looks out of place altogether. On old trees it looks very beautiful, and if left to itself it throws out its side shoots, which soon acquire the consistency of stout branches and flower profusely. On stone pillars we trim it annually to the top of the pillars, above which it forms a large head, spreading out like an umbrella, perfectly even and rigid, and flowers at every point. For such positions I don't think the Irish Ivy can rival it. On the walls here, although it does not require annual cutting, yet from the tendency of the young shoots to lose their hold of the wall the labour required to keep it right is little if any less than the other. The mansion-house here is a large one of three storeys, mostly covered with Ivy on every side; and the owner takes great pride in it, and justly too, for it is very pretty when in full dress. Several gentlemen from the South have taken cuttings from it with them, believing it to be a superior variety, which I do not believe. It has been well cared for and planted in a suitable soil,

which I think is the chief secret of having fine Ivy. Being such a hardy, accommodating plant, it is supposed to grow in anything and anywhere, but we have found that such is not the case. An artificial terrace runs round three sides of the house here, composed chiefly of loam and small stones, in which the Ivy seems to luxuriate. On the other side, which has the least exposure, but where the soil is poor and rather wet, the Ivy loses partly its palmate character, becomes of a sickly yellow colour, the leaves being in tufts with a bare portion between each tuft: it was believed to be another variety until we took cuttings of it and rooted them along with the others, when they assumed the same appearance. One plant in the centre of this wing was strong and healthy, and on examining the roots it was found to have been planted where a hole had been filled up with loam, which proves that Ivy likes a good diet as well as most other evergreens. Judging from the growth of both here, I would hesitate before planting the common variety on fine walls; where the Irish can be cut annually it is in my opinion by far the best, but on old walls, trees, or such places, the common is the best, especially if left to Nature. *J. S., Aberdeen.*

Carnation Souvenir de la Malmaison.—This proves very useful from early spring onwards into summer, either as a flowering plant for the conservatory or for rooms. The flowers are also very useful in the half-open stage for filling glasses. It is grown here in quantity, and as the mode of culture pursued is very simple, whilst the results are all that could be desired, a record of the details may be of use to those who have not succeeded with this fine old variety. The plants are mostly propagated from layers every year, as these suit us best. The way they are propagated is as follows:—As soon in summer as the young growths are large enough for layering, the plants are turned out into the kitchen-garden, and if the soil is not of the best it may be made of a suitable condition by the admixture of light potting soils, leaf-mould, &c. We find it better to layer the plants into the border than to raise heaps of prepared soil round them, as the birds give more of their attention to the analysing of these mounds than is at all desirable; provided the border is in good open condition the plants lift with good balls. The layers are made as large as possible, and left to grow in the border till about the middle of September, when they are lifted, good plants with balls, and potted up in 4 and 5 inch pots. They are left cut-of-doors, but in a shaded position, for two or three weeks, when they are removed to their winter quarters in a house where they are kept gently growing. The earlier plants are showing buds now, and by early spring the entire stock will be in a flowering condition. The main cause of failure appears to lie in the direction of keeping the plants in too cold a temperature during the winter months, in which they simply stagnate and die off. As a rule the temperature should not continue below 45°. Where larger plants are wanted the flower-spike may be nipped out when it appears, and the plants be turned out during the summer months, and be potted up with the rooted layers in the autumn, using pots not exceeding 7 inches in diameter. These should throw from six to a dozen flower-spikes and make charming plants for conservatory decoration. The bushiest of the young flowering plants treated as above will also make good two-year-old plants. Considering the great usefulness of this flower either for decorative purposes or for supplying cut flowers, which travel first-rate, also the ease with which it may be cultivated without chance of failure, we think it well worthy of recommendation. There are a couple of varieties besides the normal type in commerce. *Scotius.*

Root Pruning.—Never before has this subject been so gone into, and yet I hope this is only the beginning of a discussion on what I consider a most important subject. Your correspondent "F." (see p. 684) has gone about it in a most admirable way; his reference to Mr. Rivers reminds me of what was said about his method of root-pruning and lifting by those who were not a little sceptical about it. I well remember his trees being called "toys," and the like, because they were "miniature"; but "toys," or whatever they were, they suggested what might be done, and I will remember some twenty odd years ago, when I had from him all that he could recommend in the way of Pears, Apples, Plums, and Cherries, how I at first tried to follow his instructions, and, failing to carry them out fully to my satisfaction, the thought occurred to me that it was not really necessary to keep the trees thus "miniature," that you might allow them to develop themselves and still retain their fruitfulness, and I was thinking of contriving a machine for lifting when they got too large to manage in the way that Mr. Rivers advised, when all of a sudden it came into my mind that it might be done without, and even more to the health and fruitfulness of the tree. I thought by digging a trench round the tree, at a proportionate distance from it according to its size, and leaving some two or three

roots on one side, that it would be comparatively easy, and, with some of my men, I commenced operations, first by striking a circle round the tree and removing all the surface soil, and then digging the trench some three-fourths or so round, clearing it to the bottom quite clean, then with a Parkes' fork, carefully working out the soil into the trench—I say carefully, for without much care the roots would be pierced or scratched by the points of the fork, each perpendicular root being got up as deep as possible so that it might be placed horizontal when the tree was placed back again. This was continued till all the perpendicular roots were got up and all the horizontal ones cut off, except on the one side, after which the tree was turned back, the soil well worked over by the fork to a good depth, adding manure or compost, raising the soil in the centre some inches above the soil round the edges—that is, supposing the edge was 12 or 15 inches deep the centre would only be 9 or 12 inches (this I found a great help to securing the tree firm against the wind). Now that all is ready the tree is carefully placed in its new bed, one person or more, according to its size, steadying it, while another was placing the roots with the hand, while a third or a fourth was putting in a little well broken soil to keep the roots in their place. This done all round, the remainder of the soil was well broken and thrown in, and no treading or watering was ever practised. Few of the trees had any support, none of those that had been regularly lifted required it, but some of those that had not did, and nothing more was necessary except an occasional looking over after high winds. The next time the tree was lifted the roots that had been left were cut off and the tree turned the opposite way, leaving a few roots on the opposite side, and so on time after time; and although you would call Mr. Rivers' trees some 6 or 8 feet high "toys," you could scarcely call one between 20 and 30 feet high, with a spread in proportion, a "toy." So successful was I that I felt I had my trees under control, so to speak; that is, if I desired wood I could easily have it, or if I desired flower that I could as easily have, and flower, too, that appeared to have a surprising power of resisting adverse weather. For all this experience I considered myself under the greatest obligation to Mr. Rivers. *George Lee, F.R.H.S., Clevedon.*

Witch Knots on the Birch.—These are very common on trees here, from the size of rooks' nests down to very small ones. On one of intermediate size a pair of hawfinches selected this season to build their nest, hanging some 18 inches from the branch, where they hatched three young ones. These birds have not been so numerous here this season, I am thankful to say; green Peas and Cherries stand a poor chance with them. It is somewhere about ten years since we first had a pair here, but in Hertfordshire some forty years since I know they were very plentiful in the winter season at Knebworth Park, where they used to feed on the Hawthorn seeds, also the Hornbeam. *W. Hill, Rich Hall Gardens, Nov. 12.*

Strawberry Culture.—I fully endorse the idea of "Observer" (p. 468) as to the soil being exhausted and not the plants. I have ten beds grown on the broadcast, or what some might term "lazy-bed" system, which were all planted in 1866, and are consequently eleven years old. I had five years since doomed part of them to be broken up, but as press of work came on I was not able to do it; being considered an extra job it was put off. I thought I would help them through another year, having plenty of sewerage at command. I accordingly began during the winter months and gave them a thorough soaking, and in February or March following dressed them, or cut them down close to the crowns. I never cut my foliage off at any other time, as I consider it a bad plan. The year following I gathered an immense crop of very fine fruit, far exceeding in size and quality anything I had from them up to that time. I have since followed up the sewerage system, giving a dressing every other year. I last year gave them a thorough dressing in February with loam and good rotten dung from an old hotbed. Again last summer I picked an extraordinary crop of splendid fruit off them. I may just state the soil is of a free mixed gritty description, and appears naturally suited to the growth of the Strawberry. The plants now look as strong and as promising as ever. I do not say they are all the plants which were planted eleven years since, as I believe as the old plants wear out they rise, and by my system of close trimming in the spring they are cut off as they rise above the surface. The only difference I make as to treatment is that during the spring, when I give sewerage, I do not trim them so early; and I find as a rule the fruit is not as early those years the liquid is used as it is with manure dressing, which matters very little as a main crop. When they can be had they are always in demand. My reason for not dressing so early when sewerage is used is this: the foliage protects the crowns, whereas if they are dressed early with a good covering of manure that is sufficient protection I think. May I

just point out what I think bad practice? Many growers, after the crop is off, cut off almost every leaf close to the crown of the plant. Where grown in rows every alley is deeply dug, which, for appearance sake, I admit is all very well; but if they can survive such treatment long those that treat them so are very fortunate. Then, as a result of this early "hacking," fresh foliage is thrown up, which in my opinion weakens the plant very much for the coming season, and deep digging mutilates the roots and renders them less fit to stand against droughts. My experience teaches me that the Strawberry plant requires the soil to be very firm. *R. C. E.*

Law Notes.

SEED DYEING.—At Southwark Police Court on Monday, the 10th inst., before Mr. Benson, Walter Jacob Maas, James Frith, and Alexander Frith (trading as Frith & Maas), of Ewer Street, Borough, appeared to answer a summons under the Seeds Adulteration Act at the instance of Alexander Francis, charging them with having dyed certain seeds, namely, Clover seeds, in contravention of the Act.

Mr. Besley prosecuted, and Mr. Edward Clarke appeared for the defence.

Mr. BESLEY, addressing the magistrate, said: I dare say you are familiar with recent legislation, and it is just as well to tell you that prior to the passing of this Act in 1869 it was unfortunately a practice, very much resorted to, to mix with Swede or Turnip seeds those of a different and inferior description which had undergone a preparation by dyeing, to deceive the eye, or by "killing" so that by that fact the worthless seeds would not grow. In reply to Mr. Benson, Mr. Besley explained that the object of "killing" seed is that when mixed with seed of other kinds it should not grow and betray its worthless character. For instance, a case has recently been decided in the City of London in which the seed of Charlock, a weed bearing a yellow flower, used only for the purpose of extracting oil by a process of crushing, was sold for mixing with Turnip seeds. The farmer when he does not find a crop coming up cannot tell why it fails; it may have been a wet season, or there may be many causes to reconcile him to the loss he has sustained by fraud. And so it is in the case of dyed seeds; generally speaking they are killed by dyeing, and we shall now prove that these seeds had undoubtedly been dyed. Undoubtedly the practice prevailed to an extent, because seed merchants were obliged to compete in price with the fraudulent seed merchants. Very few cases have arisen under it, I believe, from the fact that it is difficult to obtain evidence. The present defendants carry on business at Ewer Street as seed merchants, and are also owners of machinery by which the dyeing process is done. After the passing of the Act of Parliament it was generally believed that the whole of the seed-merchants had given up such improper practices, and I believe that you may now correctly say that the offence is limited to one or two firms only. And before the magistrate at the Mansion House during the last fortnight the name of Mr. Frith was mentioned in the case of Mr. Strangeways, who was convicted of "killing" seed, and also of selling "killed" seed. Well, sir, we come to the first piece of evidence I shall give you. I shall be able to show you that the two defendants, the Friths who are mentioned there, have taken an active part in the matter, and I propose to prove it under the authority of the Act, which, for the purpose of enabling a tribunal to judge of the *malæ fides* of a delinquent, permits evidence to be given of previous transactions of the same nature for the purpose of throwing light upon that which follows after. Thus, in a case of ordinary fraud—a sale of sham jewellery—it was reserved for the Court above to decide that the previous offering of similar articles fraudulently made for the purpose of deceiving the pawnbroker was evidence of intent. I shall prove to you that in August and September a treaty took place with the young Mr. Frith, first of all about dyeing some seeds, and afterwards, in September, with the other Mr. Frith in reference to the same subject; and I shall show you distinctly that when called upon to perform the bargain which they had agreed to per-

form, they made this reply—"That they could not at present do it, because there were detectives in the Borough watching these matters; that their machinery wanted repair, and that they intended to take the opportunity of the watchfulness of the detectives to repair this machinery." That is the case against the Friths. The evidence against Mr. Maas is that he is part owner of the machinery. Through a person of the name of Robinson I shall show you the purchase of 5 cwt. 2 qr. 14 lb. of white Clover by Mr. Francis. Mr. Robinson was arranging or had arranged to send a large number of sacks of seeds to Frith to be doctored. A sale took place of 5 cwt. 2 qr. 14 lb., the contents of two sacks of white Clover seed, at 30s. per cwt. That sale at that price was made by a person of the name of Drage, and the same quantity was sent to Frith's and delivered out by them after doctoring, and a sum of 3s. 6d. per cwt. charged for doctoring, and when it was turned out it was found that it smelt strongly of sulphur, and I shall give scientific evidence of this. This was done to make it more like white Clover seed: the seed was unfit for sowing purposes: it was a mixture of the smallest grain Clover seed and a great quantity of grains of bad seed which the weevil had rendered useless, and I shall show that it is rubbish, the siftings and screenings of seed, unfit for growing purposes. It was sent forward to Frith's, sulphured by them and sent back by them, with a charge of 3s. 6d. to the firm of all these partners. When I have given you scientific evidence I shall show you that it is a clear case of sulphur smoking, and the seed has been dyed and rendered like white Clover seed when it is nothing of the kind. White Clover seed is worth from 50s. to 80s. That is the case I shall first take against the defendants, and the second case is one of dyeing the seed contrary to the 3d section of the Act; and with the invoice from the firm and the facts I have mentioned, you will be satisfied it is well founded, and that it is your duty to inflict the penalty fixed by the Act.

Mr. CLARKE: It is my duty to say that I shall give no trouble in proving the facts, or most of them, but I would call your attention to the fact that it is not an offence to dye seed or to sell dyed seed, but it is an offence to give by dyeing or colouring the appearance of seeds of another kind. I shall show you that these were white Clover seeds, and it is upon that case my client desires to stand.

Mr. BESLEY: I propose to prove my case first of all.

JOHN CHARLES OSTLER, examined by Mr. Besley: Lives at Walthamstow. About August 28 called on Frith & Maas in Ewer Street. Witness is a commission agent. Saw Mr. James Frith.

Mr. CLARKE here asked the magistrate's opinion as to this evidence. My friend has correctly opined that if he proves an offence within the Act then he is entitled to prove anterior facts; but at this moment he is not entitled to call witnesses as to a matter before the subject of the summons.

Mr. BESLEY: I was going to prove a conversation with Messrs. Frith with respect to the bargain to treat other seed.

Mr. BENSON: I am quite of Mr. Clarke's opinion, that you must not refer to anterior matters in opening a fraudulent pretence—it would not be fair.

Mr. BESLEY said he did so for the sake of chronological order.

Witness continued: Was present on November 16 with Mr. Francis at the warehouse of Mr. Robinson in Snow's Fields. Mr. Robinson is keeper of a granary, a place where the seed is housed. Was present when a sample of seed was shown by Mr. Robinson to Mr. Francis. The sample was one of very low white Clover—screenings from white Clover. Mr. Robinson wrote down the weight on paper. No bargain was made with Mr. Robinson.

In consequence of Mr. Clarke's objections, Mr. Besley stated that the order in which the witnesses were called was not of importance, and the witness was therefore ordered to stand down.

Mr. BENSON (to Mr. Besley): You did not open the transaction at all. If I understand it, it is this: these merchants are men who for a professional fee will carry through a certain process for the purpose of enabling other people to defraud.

Mr. Besley then called

ALEXANDER FRANCIS, of Barford Street, Islington, who deposed: Is a commercial traveller, and on November 16 was at Mr. Robinson's, in Snow's

Fields, Bermondsey, and was shown a sample of seed, which he now produced. Witness looked at it, and it appeared to him that it was the screenings and siftings from white Clover of very small grain, in fact, rubbish taken out of good seed. Amongst it were some worm-eaten seeds, just the ordinary kind of siftings and screenings, entirely unfit for sowing. It contained several seeds of ribbed grass.

In reply to the magistrate witness said for the purpose of separating any seeds other than white Clover seeds the seed is sifted or screened.

Witness continued: Besides small grain seeds he found foreign seeds not white Clover seeds. Mr. Robinson did not make a sale to him. The seed was bought of Mr. Drage. Witness accompanied Robinson to Mark Lane. Robinson went to Drage's. Witness was not present at that interview. Robinson afterwards produced to witness the invoice now produced.

Mr. CLARKE: I object to that.

Mr. BESLEY: I propose to argue this matter with you. I submit that for the purpose of identity we are obviously entitled to have the documents describing the sale put in.

Mr. CLARKE still objected, on the ground that it was not shown that the defendants were party to its preparation, or that either of them had signed it. But ultimately it was admitted, and the

Witness continued: Gave Robinson £10 on that occasion. Saw Robinson again on November 17 at Snow's Fields, and had some conversation with him there. Saw him again on the 19th, Monday, in the Seed Market, and again had conversation with him. On Tuesday, the 20th, again saw Robinson, and in consequence of what he said then went again on Wednesday, the 21st, and remained there the greater part of the day. Ultimately saw the van arrive with the seed. Was there when it came back, and saw it arrive at Robinson's after his boy had been sent out. There was a receiving order brought by the carman. (Receiving order produced by Mr. Robinson.) The seed was weighed, and the weight was correct. The two sacks were put on the scale at the time, and the weight was correct. (The receiving order was from Frith, Ewer Street, and was put in.) Witness did not open either sack himself, but he was there when one of the men opened one on the same day. Saw the seed had been sulphured, and it smelt strongly of sulphur. The sack was sewn up again immediately after the sample taken out had been thrown back again. Witness left the sacks there with Robinson for some time, and then instructed Mr. Dawson to call there for the two sacks. Wrote an order as on authority to Mr. Dawson's carman to get the sacks. (Order produced.) Also gave Dawson an order to lodge the two sacks at Trig Wharf, which was an authority to Trig Wharf to receive the seed. (Order produced by Mr. Scott, of Trig Wharf.) Afterwards witness went to Trig Wharf, not the same day but a day or two afterwards. Witness himself saw the seed put upon Dawson's van. Witness drew the sample at Dawson's, the seed being there, as he could not cart it into Trig Wharf the same night. Handed sample to Mr. Dyer, having first marked the same. The value of genuine white Clover on November 21, varied, according to sample, from 50s. to 80s.; witness paid 30s. Witness received Frith's account for what they had done to the seed from Robinson. The account (produced) was sent to witness by post.

In reply to the Magistrate witness said there was no note with it.

Cross-examined by Mr. Edward Clarke: The sample of seed produced was a sample of white Clover siftings—of very low white Clover.

In reply to a question from the Bench, witness said it was a very poor specimen of white Clover seed.

Continuing in reply to Mr. Clarke: Had written a letter to Mr. Robinson, but could not remember the date. (The letter was produced by Mr. Robinson, and was read.) The Clover referred to in that letter was the same of which witness had taken a sample. Had not at any time been employed where seed was coloured.

The MAGISTRATE: Are you educated in the seed-trade? Have you had experience in it? Have you experience enough to know one seed from another?—Witness: Oh yes.

Cross-examination continued: Could not say he had ever seen a sample of white Clover without some ribbed grass seeds in it.

Mr. BENSON (to witness): Can you pick out a ribbed grass seed from this?—I believe I can, your Worship. Some are yellow and some much darker. Is that anything to do with it?—No. They are a different shape altogether. Is there a very large proportion of these things?—There is a good proportion of it in that sample. I suppose there will be some expert evidence about this. Witness selected from the sample some seeds of ribbed grass, which were handed to the magistrate.

Continuing in reply to Mr. Clarke, witness said: He had given 30s. for this Clover. Had not a sample of this seed as it was returned, but there was one in court: had seen it. Did not know what value he would place upon it, because he had never examined it closely. Had nothing to do with the value, but considered himself a judge of seed.

In reply to Mr. Besley witness said the sample was quite worthless, not fit to grow at all.

Mr. RICHARD E. ROBINSON (examined by Mr. Besley): Did not send the seed referred to in the letter of November 16, which he produced, to be dyed: sent some seed to be "improved." Is a warehouse-keeper, and warehouses seed for different merchants. Did not send to Frith's at the same time, nor within a day or two, fourteen or fifteen sacks on account of John Lee Barber & Co., Lowestoft and London. Sent to Messrs. Frith & Maas 5 cwt. 2 qr. 14 lb. of seed bought by him for Mr. Francis from Mr. Drage. Believed the price was 30s., but could not remember. Invoice was made out to witness on the market, because Mr. Drage did not know Mr. Francis, and said he would sell it to witness, who would get the money. Did not arrange with Frith & Maas the price for improving. Did not notice what price they charged for the "improving."

Mr. BENSON (to witness): What directions did you give?—I just sent the seed to Mr. Frith's to be "improved." I wrote a receiving note. (This note produced.)

Examination continued: Was present when the seed came back "improved," and the bag was opened and a sample taken out. Did not take particular notice how it smelt. Weighed the seed, and the weight was correct. Sent the invoice on as it came to him. Francis wrote for it (letter produced), and upon receipt of that note witness applied for the invoice personally. Saw Mr. Frith's son, their clerk, at witness's place of business. Mr. Frith's son came in, and witness asked him for the account, which he gave. No price was mentioned, and witness did not look at it. Sent on the invoice as it was made out by Mr. Frith's son—16s. 6d. The seed was afterwards put into Dawson's van while Mr. Francis was waiting for it and in his presence.

Cross-examined by Mr. Clarke: Had only known Mr. Francis a few weeks. He was introduced to witness as a seed merchant out of business. Knew nothing about an association. Francis did not tell him he was an inspector. Saw the sample before it was purchased; it was white Clover. Mr. Francis came to witness and said, "Do you know where I can get any low white Clover seed?" Witness said, "I do not know, but here is a sample belonging to Mr. Drage." Mr. Francis saw the sample: anybody could recognise the seed as being white Clover seed. Thought there was ribbed grass seed in every lot of white Clover seed grown. This was a fair sample of not very dear white Clover. By not being dear meant that the seed was "oldish." Had had the seed twelve months in the warehouse. Seed would become dark-coloured from being badly warehoused or badly kept. Could not say if the seed when dark-coloured is as useful for growing as before, because he is not a seed merchant. The seed, taken out as a sample, when it came back from Frith's was white Clover. It had been "improved" in appearance, but you could see it was the same seed. Had no idea or intention of assisting in a fraud or would not have done it. Did not mean to be fraudulent, nor help any one else to be so. Not acquainted with the process by which the seed is improved.

Re-examined by Mr. Besley: Not aware that seed ever got sulphur by keeping. Did not know if sulphur smoking had the effect of increasing size or weight. Had never troubled to inquire what Mr. Frith did when he improved seed. Not his business.

In reply to Mr. Benson witness said: Mr. Francis first mentioned Maas & Frith. Had known them before. They are hop and seed merchants and carmen. Simply understood that when he sent things

to them they were to be improved by some process or another. Did not know that it made any palpable difference, but it makes it a little lighter colour. Had occasionally sent things to Maas & Frith's before. Could not say if it was a very common thing to sulphur up the cheaper seeds. As a short statement of the transaction, witness said Mr. Francis came and asked him if he knew any one who had low white Clover to sell. Witness said, "Well, here are some samples I am going to take over to Mr. Drage." He said, "This will do for me; ask him the price." Witness went over to Mr. Drage, and said, "Here's your samples: a gentleman wants to buy this 5 cwt. 2 qr. 14 lb. What is your price?" He said "3s. : who is it?" Witness said, "Mr. Francis." He said, "We do not know Mr. Francis; you take the invoice and get the money." Witness took the invoice, got the money, handed the invoice to Mr. Francis. He said that he wanted 5 to 6 cwt. for a friend, and told me to send it to Mr. Frith's to be "improved." Witness did not mention how Maas & Frith would "improve" it, Mr. Francis was fully aware of that.

Mr. BERNARD DYER (examined by Mr. Besley), residing at 17, Great Tower Street, is an analytical chemist, and chemist to the Devon County Association, and to the Nottinghamshire Agricultural Association and member of the Society of Public Analysts. On November 17 received two samples of seed from Mr. Francis, one of them marked. Examined the sample so marked and submitted it to chemical analysis. Detected the presence of sulphuric and sulphurous acids, showing that the seed had been submitted to the action of burning sulphur. The effect of submitting the seed to sulphur is to exert a bleaching action upon it and to freshen its appearance in somewhat the same manner as straw is bleached for straw hats or bonnets. It does not materially increase the weight. Witness found in that sample sulphur in the proportion of one grain and a fraction over to the ounce. Many of the husks of the seeds were hollow and light. Witness found among them a few grass-seeds, but did not take any particular notice of them. Did not know the value of genuine white Clover seed on November 21.

Cross-examined by Mr. Clarke: Knew nothing about any Association, and had not been appointed analytical chemist to them. Would not commit himself to the statement that sulphuring would "kill" seed.

In reply to Mr. Benson: Witness could not say it had been subjected to any very great heat, but the seed had undoubtedly been freshened up by sulphur-smoking. Many of the seeds were evidently old, and in witness's opinion worthless in their natural state except for the sulphur. This process of sulphur-smoking is resorted to for the purpose of making old and dead and practically worthless seed appear like fresh. It is done entirely for the seed trade, and has no legitimate use.

Cross-examination continued: Is fairly well acquainted with the appearance of seeds though not an expert. Has had a very large experience in the examination of seeds for discovering adulteration. Did not consider himself an expert as a botanist but as a chemist. Knew enough to say if the seed submitted was white Clover seed. Was able to say, from the sample submitted to him, that it was not new seed: very many of the seeds were hollow shells, as was to be seen on close or microscopical inspection. Inspection without the microscope would probably reveal the same fact: a man by rubbing seeds between his fingers would be able to tell the quality of the seed, although the appearance might be considerably altered.

In reply to Mr. Besley witness said he had been engaged in making analyses for the different agricultural associations on his own account for the last two years. Previous to that was for three years assistant to Dr. Voelcker, chemist to the Royal Agricultural Society. Witness further stated that there were other ways of doctoring than smoking. Asked if he had sufficient knowledge to know whether this seed, before sulphuring, was fit for growing purposes, witness said he might have an opinion upon that matter but could not speak with authority: that was tested by germination. There was no other object in sulphuring than to give the appearance of good seed to old and decayed seed. He should expect the greater part of the seed in question would not grow. Had known very many cases where good practical farmers

had been deceived. Thought it had been brought about by palming off a particular seed which had lost its germinating power by age. Asked if seed a year or two old would have lost its germinating power, witness said his opinion was that the germinating power would diminish, but he had never made any experiments. Had certainly read that seeds taken from the Egyptian mummies had retained their germinating power, but had also read records where seeds had lost that power.

Mr. CLARKE, addressing the Court for the defendants, said:—I submit, upon the construction of the Act of Parliament, there is no evidence to support a conviction. The witness has said that this was white Clover seed; the original seed he saw was white Clover seed. He writes a letter to Mr. Robinson, and instructs him to send the white Clover seed to "be done." He then receives from Frith & Maas, or indirectly, his identical white Clover seed. All that has been done in this matter is to submit white Clover seed to a process which, so far as he can say, does not mar its germinating power, which would not deceive a man of experience dealing with it, and which certainly has not altered the kind of seed. The kind of seed is white Clover, the same that it was before the process. It is white Clover seed; it was white Clover seed and nothing more before. I shall submit that upon an examination of the Act it is clear the meaning I attribute to the word "kind" is the true one. The term "to kill" means to kill by artificial power, and that would be so if they had palmed off stuff like sawdust. The killing of a seed is the killing a different seed from that asked for with the intention to defraud. Precisely the case of Charlock, a yellow flower, the seed of which resembles Turnip seed.

Mr. BENSON: I have been considering this ever since the case commenced. Though nobody can deprecate more than myself the offence with which the defendants are charged, I must concur in the objection raised by Mr. Clarke.

Mr. BESLEY: If your decision were to be acquiesced in by the persons interested in this matter, it would be in fact to render the Act of Parliament inoperative. I would suggest to you that they have infringed it if you will kindly look at the Act and see what it is aimed at. It is to prevent the adulteration of seeds, to prevent the practice of passing off seed of an inferior quality as seed of a superior quality.

Mr. BENSON: If a farmer were to sell from a fine sample and then go home and mix with his good seed other of an inferior quality?

Mr. BESLEY: Adulteration implies the reduction of the quality. If you remember in our great gin discussion there is the adulteration of gin by the introduction of one of its components parts, water, and the magistrates have decided that it was an adulteration within the Act; and a superior court has held by this decision that, if in a neighbourhood gin is sold at 30° under proof, and a man is selling at 40° under proof, that is sufficient. And I say we have not to consider the germinating power. We have not summoned upon that.

Mr. BENSON: I should have been almost inclined to have seen whether evidence could be got to show that such a process does kill the seed. But there is no evidence. I am quite sure if there could be prejudice, it would be on my part against the defendants. You may depend it is only my sense of duty under the Act of Parliament that influences me. I should like to hear you upon the argument of the appearance of seeds of another kind.

Mr. BESLEY.—I go entirely outside that. I say that when we deal with the interpretation of an Act of Parliament it does not exclude the natural meaning of the word, and that is clearly proved by the decisions which have taken place upon the meaning of certain words. For instance, I believe upon the meaning of "valuable security." It has a meaning attached to it by the Larceny Act, but it was held that a person might be guilty of attempting to extort a valuable security other than as defined by the Act. You are at liberty to construe the meaning of an Act of Parliament by the ordinary meaning of a word. But I contend it could not have been intended that it should have left untouched the act done by Messrs. Frith & Maas here, namely, to deceive the eye of a customer who is looking at the seed and thinks it is new seed where they know well that it is old seed prepared by sulphurous smoke or otherwise to make it appear like fresh seed.

Mr. BENSON: Supposing this interpretation clause had not existed, in that case you would have been convicted, Mr. Clarke.

Mr. BESLEY: Well then, sir, I submit that it does not mean to give the appearance of Clover seed, the appearance of Swede or Turnip seed. I must also submit that giving the appearance of new Clover seed to old Clover seed is a matter of kind. Mr. Besley proceeded to ask that the summons should be amended to one of "killing" seed, and stated that in the case already referred to the "killing" had been proved by a careful preparation of soil for discovering the germinating power, sowing the seeds and subjecting them to the proper temperature, and finding that none came up. Mr. Besley asked for a summons against the defendant for "killing" this seed, as he was limited in point of time.

Mr. BENSON would like it taken at once, and would grant a case upon the meaning of the word "kind." Mr. Besley, however, did not then take the case.

In dismissing the summons, Mr. BENSON, addressing the defendants, said: I regret to feel myself compelled to dismiss the summons against you. I am very sorry for it.

Natural History.

PHYTOPTUS GALLS (WITCH KNOTS).—The unequal distribution of witch knots, that your correspondent draws attention to in No. 202 of the *Gardeners' Chronicle*, and which is so very striking where Birch trees grow in near neighbourhood, seems to be caused by the habits of the Phytoptus keeping it mainly in the buds, instead of, as with some (very possibly all) of those which form the galls on deciduous leaves, sending them astray with the season of the withering leaf.

In examining the Birch buds I have found Phytoptus lodged inside during the whole of the year—they may be elsewhere, but I have not noticed them—but with the leaf Phytoptus galls, such as those of the Maple, or the nail or cowl-like growths of the Lime, a microscopic examination of the under-surface of the leaf on which they grow during September will show the Phytoptus straying about, whilst others close by are to be found moving on the twigs, or—their autumn move apparently satisfactorily over—snugly secured amongst the scales at the base of the leaf-bud, not fairly inside as in the Birch bud, but so as to make the most of the shelter given by the axillary position of the bud.

The gall mite comes out of the egg perfectly developed, its embryology being traceable with the aid of a quarter-inch object-glass, from the obtusely oval and white egg, through the alterations in figure and size (showing, with the addition of a little turpentine, the form of the contained object,) to the exclusion of the perfect Phytoptus.

Its minute size might seem to militate against its existence where winter wet must often drench its shelter, but it will stand immersion for more than an hour and a half without destroying its vital powers, and with the larger-leaved trees, the autumn galls, bearing the leaves and their living passengers before them, must act as powerful agents of dispersal. O.

TOMATOS AND COAL ASHES.—Both Tomatos and Potatos are good this year where they have a monopoly of the soil—very good on manured lands, and phenomenally good on rich soils, which have been farther enriched by coal ashes. Having casually observed the effects of coal ashes to be, as I thought, something out of the common on Tomatos, increasing not so much the growth of the plants as the size, smoothness, and number of the fruit produced, a market gardener of experience confirmed my suspicion, and last spring I accepted his directions for

their use, which were to throw out a wheelbarrow load of earth where each plant was to stand, and then fill with half soil and half coal ashes, and therein set out the plants. I did so, and the result was quite surprising, the dozen plants thus treated bearing nearly double the fruit of others, and smoother and larger; but Tomato plants so set will, in case of drought, require water oftener, and more of it, than those growing in common soil. *Country Gentleman.*

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, Dec. 12, 1877.

Dec. 6.—Dull, with occasional showers till afternoon, then fine and bright.
 7.—Fine and bright till noon, overcast and dull after. Heavy rain in evening. Solar halo seen at 10.30 A.M.
 8.—A fine day. Cloudy, cold and dry.
 9.—A fine bright day. Occasional sunshine.
 10.—A dull, cold, cloudy day. Hoar frost at night.
 11.—Fine till 11 A.M., overcast and dull after. Cold. Fog and hoar-frost in morning. Temperature of air at 9 A.M. was 33°.4, at 3 P.M. was 42°.2, at about 6 P.M. was 37°.2, and at midnight was 44°, which was the maximum for the day.
 12.—A very fine clear day. Mild till evening then cold. Rain fell in early morning.

LONDON: *Barometer.*—During the week ending Saturday, December 8, in the neighbourhood of London, the reading of the barometer at the level of the sea increased from 29.64 inches at the beginning of the week to 30.18 inches by the morning of the 3d, decreased to 29.46 inches by the afternoon of the 6th, and increased to 30.28 inches by the end of the week. The mean reading for the week at sea level was 29.97 inches, being 0.60 inch above that of the preceding week, and 0.02 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 54½° on the 6th to 46° on the 4th; the mean for the week was 48°. The lowest temperatures of the air observed by night varied from 34½° on the 8th to 40½° on the 4th; the mean value for the week was 38½°. The mean daily range of temperature in the week was 9½°, the greatest range in the day being 15½° on the 6th, and the least 5½° on the 4th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—December 2, 42°.5, +0°.7; 3d, 44°, +2°.2; 4th, 43°.1, +1°.3; 5th, 42°.3, +0°.6; 6th, 47°, +5°.4; 7th, 44°.0, +3°.1; and 8th, 40°.9, -0°.5. The mean temperature of the air for the week was 42°.9, being 1°.8 above the average of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 84½° on the 2d, 76½° on the 6th, and 71½° on the 8th; on the 3d the reading did not rise above 49°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 31° on the 2d and 8th, and 33° on the 3d; the mean of the seven low readings was 35°.

Wind.—The direction of the wind was N.N.E. and W.S.W., and its strength moderate. The weather during the week was dull and wet, and the sky very cloudy. A solar halo was seen during the morning of the 7th inst.

Rain fell on six days during the week, the amount collected was 0.52 inch.

ENGLAND: *Temperature.*—The highest temperatures of the air observed by day were 54½° at Blackheath, 54° at both Truro and Plymouth, and 53½° at both Bristol and Portsmouth; the highest temperature

of the air at Hull and Sunderland was 49°, and Bradford was 49½°; the mean value for the week from all stations was 52°. The lowest temperatures of the air observed by night were 29½° at Wolverhampton, 31° at both Cambridge and Truro, and 32° at both Eccles and Hull; the lowest temperature of the air at Liverpool was 38½°, and at Brighton, Portsmouth, and Bradford 36½°; the general mean from all stations was 34½°. The range of temperature in the week was the greatest at Truro, 23°, and the least at Sunderland, 13°; the mean range from all stations was 17½°.

The mean of the seven high day temperatures was the highest at Truro, 50½°, Plymouth 49½°, and Portsmouth 49½°; and the lowest at Bradford, 44½°; the mean value from all stations was 47½°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 34½°, Eccles 35½°, and Truro 36½°; and the highest at Norwich 41°, and Sunderland 40½°; the mean from all stations was 38½°. The mean daily range of temperature in the week was the greatest at Truro, 13½°, and the least at Bradford, 5½°; the mean daily range of temperature from all stations was 8½°.

The mean temperature of the air for the week from all stations was 42½°, being 4½° lower than the value for the corresponding week in 1876. The highest were 44½° at Portsmouth, and 43½° at both Norwich and Sunderland; and the lowest at Wolverhampton, 40°, and Eccles, 41°.

Rain fell on every day in the week at Cambridge, Norwich, and Sheffield, and on four or five days at most other places. The amounts measured varied from 1 inch and one-tenth at Bradford and 1 inch at Sheffield to three-tenths of an inch at Wolverhampton and Sunderland. The average fall over the country was seven-tenths of an inch.

The weather during the week was dull and showery.

Snow fell at Bradford on the 7th inst., and Hail fell at Liverpool on the 7th inst.

SCOTLAND: *Temperature.*—The highest temperatures of the air varied from 51° at Leith to 47° at Dundee, Greenock, and Paisley; the mean from all stations was 48½°. The lowest temperatures of the air varied from 31° at both Aberdeen and Paisley, to 34½° at Leith; the mean value from all stations was 32½°. The mean range of temperature in the week from all stations was 16½°.

The mean temperature of the air for the week from all stations was 40½°, being 3½° lower than the value for the corresponding week in 1876. The highest was 41½°, at Glasgow, and the lowest was 39½°, at both Paisley and Perth.

Rain.—Rain fell at Greenock to the amount of 2.11 inches, whilst at Edinburgh and Leith a quarter of an inch only was measured. The average fall over the country was 0.64 inch.

DUBLIN.—The highest temperature of the air was 53°, the lowest was 28½°, the range 24½°, the mean 42½°, and the fall of rain a quarter of an inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.

220. CHINA: A Subscriber asks if there are any choice and valuable Orchids to be obtained in China; and if any, what are the prevailing species. [Yes, species of Cymbidium, Calanthe, &c.] Also if there are any nurserymen in China, from whom a person going there could obtain a quantity of really first-class Liliun bulbs in variety, and especially Liliun auratum; and what month they are at rest there. Neither a Flora of China, nor a Chinese Horticultural Directory has yet reached us. Perhaps our correspondent could get the information from the Chinese Embassy; certainly we have little to give him.

Answers to Correspondents.

ADDRESS: A Subscriber. There are several florists and fruiterers of the same name in London, four in Covent Garden alone. Which do you mean?

APPLE, POMME VIOLETTE: J. P. We cannot say where you can get this old variety in this country, but we note that it is included in the lists sent out by Simon-Louis Frères, nurserymen, Metz, Lorraine, Germany.

BOOKS: G. W. Paxton's *Botanical Dictionary* (Bradbury, Agnew & Co.).—T. Richardson. Paxton's *Botanical Dictionary*. We do not think you can get London's list in the way you suggest.

CAMELLIA BUDS FALLING OFF: G. W. Your question has been asked scores of times, but the same answer does not apply in all cases. It may be owing to the want of moisture at the roots; but we cannot say in the absence of details.

CHRYSANTHEMUMS: E. H. Kelso. We do not know where to look for the measurements of the largest Chrysanthemum flowers on record, and consequently cannot answer your first question. Do we think it can be true that a friend of yours has grown flowers of the white Queen of England 8 inches in diameter? Well, we do not think it improbable, but we have never seen any so large that we can remember.

COMPOSITION FOR PIPES: St. Andrews. Paint made of lamp black and linseed oil.

DAISIES ON LAWN: T. B. Try Watson's Lawn Sand; we have heard it well spoken of, though we have never tried it. Or, you can remove the Daisies with a spade, scatter some seeds of good lawn grasses, and dress the surface with some good fresh earth.

ERICAS: B. E. S. You do not give us sufficient information to enable us to judge of the cause, but as you have been troubled with mildew we think it probable that you have allowed the plants to get too dry at the roots.

INSECTS: R. S. A. L. The bark of the Pear tree is infested with the mussel scale, *Aspidiotus conchiformis*, a very troublesome pest to get rid of, on account of the difficulty of getting at them. If you can spare time now better than in May, when the

FIG. 147.—THE MUSSEL SCALE.

young brood begins to make its appearance, the bark scraped with a piece of hard wood shaped like a knife-blade, and subsequently scrub the shoots with paraffin, using a hard brush.

Fruit Trees Dying: J. P. No wonder that your Cherry-trees are dying, and the other fruit-trees showing signs of going the same way, if the soil they are growing in is fairly represented by the sample sent. It is nothing but a mass of the spawn of a fungus, in which no tree can exist long. How to account for it we are unable, in the absence of any details; but if all the ground is alike, we would not advise you to waste any time or money over planting any more trees in the same ground. You had better by far find another site for a new orchard, and by-and-by grub up the trees in the old one, and put the land under a liberal system of manuring and deep cultivation for a few years to clean it.

MONSTROUS MUSHROOM: S. Kippis. Instances of Mushrooms growing on the top of one another are by no means rare, and such peculiarities have been

FIG. 148.—MONSTROUS MUSHROOM.

more than once illustrated in our columns. See our volume for 1873, pp. 1016, 1017.

HOLLIES DROPPING THEIR LEAVES: T. B. The leaves doubtless fell off in consequence of removal. You can do nothing to prevent it, but shelter the plants from rough winds. It is much better that they should drop than wither on the tree, and in spring the trees should rehabilitate themselves.

MEALY BUG: J. M. If you use the soft soap and water hot you will find it very effectual. Don't use paraffin in any form, but try either the Chelsea Blight Composition, sold by Messrs. Veitch & Sons, or Bridgeford's Antiseptic Liquid, sold by Mr. Bridgeford, seedsman, Sackville Street, Dublin. We have letters which we hope to find room for shortly, highly praising both of these compositions.

NAMES OF PLANTS: Horticulteur. You must send better specimens. We cannot afford to waste time over such scraps.—A Subscriber. Probably some climbing Leguminous plants. We do not recognise the seed.—W. B. We do not recognise your plants.—T. W. 1, Retinospora filicoides; 2, Picea Lowiana; 3, Taxus tardiva (adpressa); 4, Libocedrus chilensis; 5, Torrya nucifera; 6, Retinospora pisifera filifera.—T. M. Your "Cattleya" species is *Epi-*

dendrum ciliare, one of the oldest and most venerable of Orchids, boasting the authorship of Linnaeus himself. Never mind. Solamen miseris socios habuisse malorum. You are not the first who has fallen a victim to this usual quail pro quo, nor will you be the last. If, however, you would like to know how to escape it, ask Mr. Stuart Low, who will tell you all about it. Ask him about Mr. Bridge's famous sale of 1856. H. G. Rehb. f.-j. K. Next week.—F. H. C. The true Arundinaria falcata; the plant generally so called is properly called Thamnocalamus Falconeri.—G. W. 1, Begonia sanguinea; 2, Abutilon marmoratum; 3, Eupatorium, perhaps glutinosum; 4, Trachelium cœruleum; 5, Phlebodium aureum; 6, Selaginella pubescens.—Bob. 1 and 2, Cypripedium insigne; 3, C. insigne, var. Maulei.—T. S. P. Zygopetalum crinitum.—E. Straker. Dendrobium chrysanthum.—D. B., Woolwich. Zygopetalum Mackayl.

PETROLEUM: H. W. E. No injury will accrue from its use if you do not turn the wick up too high, and especially if there is a little ventilation on.

POPLARS: Comjee. Write to Mr. Anthony Waterer, Knapp Hill, Woking.

STOVE: W. K. R., Glenlyn. The terra-cotta stoves sold by Mr. Roberts, 12, Victoria Street, Westminster, S.W., will probably answer your purpose.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, December 13.

We have no alterations to quote this week. Supplies, though short, are fully equal to the demand. Kent Cobs are making a better trade. James Webber, Wholesale Apple Market.

Table with 2 columns: Fruit and Price. Includes Apples, Grapes, Lemons, Nuts, Cobs, etc.

VEGETABLES.

Table with 2 columns: Vegetables and Price. Includes Artichokes, Asparagus, Beans, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Batavian, Garlic, Potatoes.

CUT FLOWERS.

Table with 2 columns: Cut Flowers and Price. Includes Abutilon, Arum Lily, Azalea, Bouvardias, Camellia blms., Carnations, Christmas Roses, Chrysanth., Epiphyllum, Eucharis, Euphorbia jacquiniifolia, Gardenia, Heliotropes, Hyacinths, etc.

PLANTS IN POTS.

Table with 2 columns: Plants in Pots and Price. Includes Azalea, Begonias, Bouvardias, Camellia, Chrysanth., Clematis, Coleus, Cyclamea, Cyperus, Dracena terminalis, Erica Hyemalis, Fuchsias, etc.

* The demand for flowers being much increased for Christmas decorations, &c., the above prices must only be taken as a guide at this season, and must not be fully relied on.

SEEDS.

LONDON: Dec. 12.—The attendance on our market to-day was above the average, and there was an improved inquiry for farm seeds. Every description of red Clover keeps firm at late currencies. The American markets are also all reported to be exceedingly strong; latterly, the supplies in the West had been light, owing, to some extent, to unfavourable weather; but growers, moreover, in the hope of higher prices, had been keeping back their produce. It is evident that holders in the United States are unwilling to believe that the superabundance of the supply from France will render England this year largely independent of America. Several samples of new home-grown red are now appearing on Mark Lane, for which unduly high rates are demanded. Taking into account the comparative cheapness this season of really fine French seed, English farmers will go wrong if they base their present demands on the extravagant terms obtained last autumn. There has been some business doing in white at full quotations; choice parcels in particular having met a good request. In Alsike there is no material alteration. Trefoils, although neglected, well maintain their values. New American Timothy is very fine, and on account of its low price attracts attention. Surprise is often expressed on the other side of the Atlantic that this seed is not in greater favour in this country. In Sainfoin, Rye-grass, Lucerne, there is scarcely anything doing. The nearness of Christmas, and the consequent disinclination to embark in speculative dealings, naturally exercise a quieting influence upon those articles not needed for immediate use. Canary seed is rather firmer, the market having been relieved by some shipments to New York. The new Baltic Hemp seed proves satisfactory, both as regards price and quality. Linseed is easier. In blue Peas there is no variation. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade at Mark Lane on Monday was firm. As regards Wheat, more especially foreign, there was a better inquiry, and a moderate business was concluded at the full prices of the previous Monday. Barley met with a limited demand, and prices were no better. Malt remained dull on former terms. Oats were a slow sale, and prices were the same. Maize moved off at recent currencies. Beans and Peas were unaltered, and no decided change was established in flour. American barrels were held for 6d. advance in some instances.—There was no important feature in Wednesday's trade. Business was generally very quiet, and prices were much the same, although the tone was moderately firm. The milder weather constitutes an unfavourable influence upon the trade, inasmuch as it is adverse to the sound preservation of the produce.—Average prices of corn for the week ending December 8.—Wheat, 45s. 4d.; Barley, 44s. 1d.; Oats, 23s. 10d. For the corresponding week last year:—Wheat, 49s. 1d.; Barley, 38s. 10d.; Oats, 25s. 4d.

CATTLE.

At Copenhagen Fields on Monday there were fewer beasts than on Monday se'night, the weight of meat was, however, proportionably larger. The trade was active for choicest qualities at fully the previous Monday's quotations. For sheep there were more buyers than of late, but prices could not be quoted higher, only the choicest qualities made our top quotations. Trade was scarcely so brisk for calves as of late, still choicest qualities maintained late prices. Quotations:—Beasts, 45s. 8d. to 55s. 4d., and 55s. 10d. to 65s. 2d.; calves, 5s. 8d. to 6s. 4d.; sheep, 55s. 4d. to 55s. 8d., and 65s. 4d. to 75s.; pigs, 35s. 8d. to 45s. 8d.—On Thursday the cattle trade was in much the same position as on the previous market day. Supplies of beasts were above the average for a Thursday, but those of sheep were short. For fine kinds a fair inquiry prevailed, at full prices; otherwise business was quiet. Calves sold at full quotations.

HAY.

The Whitechapel report for Tuesday states that, with rather a short supply, dry weather, and a brisk trade, prices were firm. Prime Clover, 100s. to 135s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 100s.; inferior, 70s. to 85s.; and straw, 44s. to 54s. per load.—Cumberland Market quotations:—Superior meadow hay, 100s. to 120s.; inferior, 80s. to 92s.; superior Clover, 126s. to 135s.; inferior, 95s. to 108s.; and straw, 53s. to 58s. per load.

POTATOS.

The Borough and Spitalfields reports state that there is not much trade, and quotations show no material change. The tone as regards foreign Potatoes, the supplies of which continue liberal, is distinctly weak. Kent Regents, 150s. to 165s.; Essex ditto, 140s. to 155s.; rocks, 100s. to 120s.; kidneys, 120s. to 140s.; the imports into London during the past week were 119,087 bags from Hamburg, 32,402 bags 328 tons Stettin, 12,722 bags Antwerp, 7737 bags 122 tons Bremen, 2533 bags Ghent, 1761 Hurlingen, 2324 sacks Dunkirk, 2210 sacks 596 bags Brussels, and 142 bags Rotterdam.

COALS.

There was little variation in the quotations recorded for Monday and Wednesday—the figures for the latter day being almost a repetition of those for the former, viz.:—Walls End—Hetton, 18s. 6d.; Hetton Lyons, 16s. 3d.; Hawthorns, 16s. 3d.; Lambton, 18s.; Original Hartlepool, 18s. 6d.; South Hetton, 18s. 6d.; Vaues, 16s. 3d.; East Hartlepool, 18s. 3d.

AMIES' CHEMICAL MANURE. USED BY THE ROYAL HORTICULTURAL AND BOTANICAL SOCIETIES.

This Manure, after six years' trial, is unapproached in its results by any other manure. It is suitable for all soils, and permanently improves the fertility of even the poorest. It provides the necessary foods for plants, creates a vigorous growth without over-stimulating, and it increases the produce. It is a powerful insecticide. It has been used with perfect success on FLOWERS, SHRUBS, VEGETABLES, FRUITS, GRASS, VINES.

PREPARED IN A FINE, DRY, INODOUROUS POWDER. Prices, £12 per Ton; 15s. per Cwt.; and in Canisters, 1s. 2s. and 4s. each. Trial Orders of the Manure are invited, to be used in comparison with other Manures. Write for Further Particulars to AMIES' CHEMICAL MANURE CO. (LIMITED), 79, MARK LANE, LONDON, E.C.

ODAMS' MANURES FOR ALL CROPS.

Manufactured by the NITRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 acres of Land. Chairman—ROBERT LEEDS, Keswick Old Hall, Norwich. Managing Director—JAMES ODAMS. Sub-Manager and Secretary—C. T. MACADAM. CHIEF OFFICE—109, Fenchurch Street, London, E.C. WESTERN COUNTIES BRANCH—Queen Street, Exeter. Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1850, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 1s., 3s., and 70s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

BEST AND CHEAPEST INSECTICIDES. Duty Free, under permission of the Honourable Board of Customs.

J. G. WAGSTAFF, Albert Ironworks, Dukinfield.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1872, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners! This was **THE CHAMPION, Deards' Patent Close-Coil Boiler,** for Drawings and Prices of which send two stamps to

Messrs. **DEARDS, Boiler Works, Harlow,** who now have their Boilers at work in every county of England except three. Amateurs will also find **THE WONDER,** a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most **SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER** extant; recently improved.

Copy of a Testimonial.
 "Royal Exotic Nursery, King's Road, Chelsea, S.W.—Aug. 3, 1877.
 "GENTLEMEN,—In reply to your enquiry as to our opinion of your Stevens' Treatham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Treatham Boiler, and we have now *thirteen* of various sizes at work. For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Treatham Boilers supplied by you, and we have never felt so little anxiety in connection with our hot-houses during the cold winter months as we do now.
 "We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.
 "We are, Gentlemen, yours faithfully,
"JAMES VEITCH AND SONS."

For Illustrations, with full particulars, apply to the Sole Makers,
F. & J. SILVESTER,
 HOT-WATER ENGINEERS, &c., &c.,
 Castle Hill Works, Newcastle, Staffordshire.
 Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

GEORGE'S PATENT CALORIGEN,

FOR **Warming and Ventilating Small Conservatories.**

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory.
 Made in Wrought Iron, £3 3s.
 Made in Copper, £5.
 Height, 28 inches; diameter, 14 inches.
 It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).

Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C.
 This Stove introduces a strong current of warmed (not burnt) fresh air.

STOVES, Terra-Cotta! Portable! For Coal! ROBERTS'S PATENT.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0

28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Ballam Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in use."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, South-work, London, S.E. When ordering Boilers please refer to the above advertisement.

Borough of Nottingham.

SUPERINTENDENT OF RECREATION

GROUNDS and HEAD GARDENER.—The Public Walks and Recreation Grounds Committee require a competent person to undertake the duties of Superintendent of Recreation Grounds and Head Gardener. The salary will be £100 a year, payable monthly. No person who has not a practical knowledge of Gardening and the Management of Shrubberies and Pleasure Grounds need apply. Applications, stating the age, and the present occupation of the applicant, with testimonials enclosed, to be sent to me, endorsed "Application for situation of Superintendent of Recreation Grounds, &c.," on or before December 24, 1877. Personal canvass of the members of the Committee is strictly prohibited.—Dated this 6th day of December. By order, SAM. GEO. JOHNSON, Town Clerk. Municipal Offices, Nottingham.

WANTED, a HEAD GARDENER.—The situation of Head Gardener to the Earl of Ashburnham will be vacant shortly. Apply, by letter, to ROBERT HODGSON, Esq., Ashburnham Place, Battle, Sussex.

WANTED, a HEAD WORKING GARDENER, age between 30 and 35; he must thoroughly understand the profession in all its branches; and have lived principally in private service. One other kept. Wages, 32s. advancing; no rooms.—Apply, personally, between 9 and 10 in the morning, or by letter, with full particulars, in own handwriting, to R. B., 42, Lee Terrace, Blackheath, S.E.

WANTED, a HEAD WORKING GARDENER, who thoroughly understands the Cultivation of Grapes, Peaches, Strawberries, &c., also Propagation and Cultivation of Hard and Soft-wooded Plants for Bloom entirely for Market. To a thoroughly trustworthy and energetic man a liberal salary would be given.—Apply, with references, by letter only, to A. B., 77, Wells Street, Oxford Street, W.

WANTED, for the Bramall Estate, near Stockport, Cheshire, a GARDENER who is also accustomed to Nursery Gardening. No glass.—Apply, by letter, to Mr. JOHN EDWARDS, 12, Commercial Buildings, Cross Street, Manchester.

WANTED, a respectable Youth, as Outdoor APPRENTICE, to the Nursery Business and Fruit Growing. A good opportunity.—W. W., Messrs. Flanagan & Son, 98, Cheapside, London, E.C.

WANTED, a steady, respectable MAN, to take charge of Fires, and to fill up his time in the Houses; one used to Painting and Glazing preferred. Wages, 20s. per week, and both if single. Must have filled a similar situation.—RICHARD BULLEN, Woodlands Nursery, Hither Green, Lewisham, S.E.

WANTED, IMMEDIATELY, an experienced BOOKING CLERK. One who has been accustomed to the Nursery and Seed Trade preferred.—Apply, in own handwriting, giving full particulars as to previous employment, references, and salary expected, to OSBORN AND SONS, Fulham Nurseries, London, S.W.

Seed Trade.

WANTED, an ASSISTANT SHOPMAN. Permanent situation, with increasing salary, if suited.—Apply, stating full particulars, in own handwriting, to G. & W. VATES, Seed Merchants, Manchester.

WANTED, a JUNIOR ASSISTANT, for Seed Shop.—Apply, stating terms, with references, to JOHN JEFFERIES AND CO., Seed Warehouse, Oxford.

WANTED, a Youth, as ASSISTANT and IMPROVER in the Seed Trade. Must write a good hand and produce unexceptionable references.—THOMAS WHALLEY, 12, St. George's Crescent, Liverpool.

WANTED, a DRAUGHTSMAN, who can Draw and Colour Flowers well.—L. R. AND CO., 5, Henrietta Street, Covent Garden, W.C.

WANT PLACES.

E. G. HENDERSON AND SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for re-engagement.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time be glad to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

GARDENER (HEAD), where four or five are kept.—Age 29, married, no embeurcance. Good experience.—H. T. S., Cuxwold Hall, Caistor, Lincolnshire.

GARDENER (HEAD).—Age 30, married; understands Vines, Peaches, Melons, Orchids, Stove and Greenhouse Plants, and Flower and Kitchen Gardening. Good character.—L. R., High Street, Harborne, near Birmingham.

GARDENER (HEAD).—Age 40, married; twenty-five years' experience. Has been living for the last two years in the North.—C. P., 9, Compton Street, Brunswick Square, W.C.

GARDENER (HEAD).—Age 35, widower; thoroughly competent in every department. Distance no object. Good character.—GARDENER, 42, Lee Terrace, Blackheath, S.E.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 33, single; well up in every branch. Highly recommended.—Address full particulars to C. J. A., 12, Church Terrace, Lee, Kent.

GARDENER (HEAD), where two or three are kept.—Age 30, married, one child; thoroughly understands Hothouse and Fruit, Flower and Kitchen Gardening. Good character from present and previous situation.—T. W., the Lodge, Drayton House, Castle Hill, Ealing, Middlesex.

To Noblemen and Gentlemen.

GARDENER (HEAD), where a thoroughly practical, trustworthy Man is required.—Age 40, married, no family; thoroughly experienced in every branch of the profession, and can be highly recommended from last and previous employers.—R. H., 50, Waterford Road, Fulham, S.W.

GARDENER (HEAD), where five or more are kept.—Married, no family; thoroughly understands Stove and Greenhouse Plants, Vines, Cucumbers, Melons, and the general routine of a Garden; over twenty years' experience. Four years' good character from last situation; eleven years in previous situation. Wife good Dairywoman.—W. P., T. Rasey, "British Workman," Redhill.

GARDENER (HEAD), age 31, married.—R. SLEIGHTHOLM, Fairfield House, Armley, Leeds, offers his services to any Nobleman, Lady, or Gentleman requiring a really competent person as above; well up in the Cultivation of all kinds of Fruits, Flowers, Plants, and Vegetables, Early and Late Forcing, &c.; understands Land and Stock. Excellent reference.

GARDENER (HEAD).—Age 30; fifteen years' character from former and present employer. My employer will allow any Gentleman wanting a Gardener to inspect the gardens of which I have the entire management, including Glass in every department, Kitchen and Flower Gardens, Parks, Plantations, and the usual routine of a gentleman's place.—R. W., Goldsmith's Park, Tunbridge Wells.

GARDENER (HEAD, WORKING).—Age 33; married; thoroughly practical in all branches of the profession. Good character from present and previous employers.—GARDENER, Northfleet House, Northfleet, Kent.

GARDENER (HEAD, WORKING), where more are kept.—Married, no family; understands Stove and Greenhouse Plants, Conservatory, Vines, Melons, Cucumbers, and Flower and Kitchen Gardening.—R. WALKLING, Holly Gardens, Thorneywood Lane, Nottingham.

GARDENER (HEAD, WORKING).—Practical; understands the profession in all its departments, order, neatness, and cleanliness, both indoors and out, being considered by him essential to good Gardening. Active, healthy, intelligent, and in the prime of life. Any Lady or Gentleman requiring such will please to communicate with J. Z., 145, Vine Street, Liverpool.

GARDENER.—Age 30, married, no family; has a good practical knowledge of the profession. Two years' good references. South preferred.—GARDENER, Ladywell House, Roundhay, Leeds.

GARDENER (Good SECOND, or SINGLE-HANDED, or where two or three are kept).—Age 25; thoroughly understands Glass, Kitchen Garden, and Lawn Work. Good reference.—G. B., Mount Villa, Garland's Road, Redhill, Surrey.

GARDENER (SECOND).—Age 24; nine years' experience. Good character.—S. T., Chelsea Wharf, Lotts Road, Chelsea, S.W.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 26; well up in the profession. Eleven years' experience. Good character.—J. S., Mr. Newberry, Bletchingley Common, Surrey.

To Nurserymen and Florists.

FOREMAN and PROPAGATOR, to any Nurseryman or Florist requiring an energetic working Man; well qualified to Grow Plants and Flowers for Market. References to Mr. William Badman, Cemetery Nursery, Gravesend.—ALPHA, 1, Adelaide Terrace, Wandsworth Lane, Wandsworth, S.W.

FOREMAN, or SECOND, in the Houses.—Age 24. Eleven years' experience in every branch of the profession. Highest reference from present Gardener.—JOHN PAGE, Newton Hall Gardens, Stockfield-on-Tyne.

JOURNEYMAN (Good), in a large Establishment, in the Houses preferred.—Age 27. Good reference. R. ALLEN, The Gardens, Worsbrough Hall, Barnsley, Yorkshire.

IMPROVER.—A Youth, aged 18, wishes to obtain employment under a good practical Gardener. A Premium of £5 will be given.—J. B., 7, Cornwall Mews, South Kensington, S.W.

To Nurserymen, Florists, &c.

FOREMAN and SALESMAN, in an Establishment requiring the services of a trustworthy Man.—Age 38. Can be highly recommended.—A. B., 16, Hethop Street, Maida Hill, N.W.

Seed Trade, or Seed and Hot Trade, Wholesale. SALESMAN, or TRAVELLER.—Young; experienced. Satisfactory references.—ALPHA, Box 15, Post-office, Leith.

SHOPMAN (HEAD).—Age 28; twelve years' experience in leading London and Provincial Houses, both Wholesale and Retail. Good knowledge of plants. London preferred. First-class references.—G. H., 168, Fulham Road, Fulham, S.W.

SHOPMAN (ASSISTANT).—Age 22; has had six years' experience in good Retail Houses. Good references.—J. E., Messrs. Hurst & Son, 6, Leadenhall Street, E.C.

AGENT in LONDON (Agri-Horticultural).—The Advertiser, who has had many years' experience among the leading English and Continental Houses connected with the above, and who has during the past seven years transacted the London Business of a well-known Provincial firm retiring at Christmas next, is open to arrange with another House of good standing in a similar capacity, either at his present office, situate in the very centre of the City, or elsewhere, or would accept Resident Country Agency of House or Landed Property, and give accurate returns of all receipts and disbursements pertaining thereto. Unexceptionable references given and required.—CURATOR, Gardeners' Chronicle Office, W.C.

TO SEEDSMEN, &c.—A young Man, with seven years' experience, desires a situation; has served as Warehouseman, Shopman, Traveller, and Bye-grass Buyer, for best houses in the Wholesale and Retail Trade. Moderate salary expected. Is a Teetotaler.—G. M., 4, Duncairn Terrace, Belfast.

BOOK-KEEPER, or CLERK, in a Nursery or Seed Business.—Age 33. First-class references.—K. W., 34, Upper Park Street, Clifton, Bristol.

KINAHAN'S LL WHISKY. Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says: "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

JAMES EPPS & CO.

HOMEOPATHIC CHEMISTS.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants. DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT and PILLS.

—During every break of wintry weather exertions should be made by the afflicted to recover health before unremitting cold and trying storms set in. Throat ailments, Coughs, Wheezings, Asthmatical Affections, Shortness of Breath, Morning Nausea, and Accumulation of Phlegm can readily be removed by rubbing this fine derivative Ointment twice a day upon the chest and neck. Holloway's treatment is strongly recommended with the view of giving immediate ease, preventing prospective danger and effecting permanent relief. These all-important ends, his Ointment and Pills can accomplish, and will surely prevent insidious diseases from fastening on the constitution to display themselves afterwards in those disastrous forms that will probably embitter life till death itself is almost prayed for.

SUTTON'S NEW OR IMPROVED VARIETIES OF VEGETABLES, FLOWERS & POTATOS

THE LATEST BROCCOLI.

SUTTON'S LATE QUEEN BROCCOLI.

From THE GARDEN, May 16.—"Late Queen Broccoli is a cream-coloured kind just now in perfection, the heads of which measure 27 inches in circumference. It is the latest Broccoli in Messrs. Sutton's trial grounds, and owing to the size of the heads, their closeness, and fine form, it promises to be a great acquisition to late Broccoli."

Price 1s. 6d. and 2s. 6d. per packet.

A new and distinct Green-fleshed Melon.

SUTTON'S WHITEKNIGHTS FAVOURITE

Price 2s. 6d. per packet.

THE BEST FLAVOURED PEA

From Mr. WILLIAM PATERSON, Gardener to Her Majesty the Queen, Balmoral.
"Your Duchess of Edinburgh is a most splendid Pea, both as a cropper and for cooking."

Mr. C. PENNY, Gardener to H. R. H. the Prince of Wales, Sandringham, says:—
"Your Duchess of Edinburgh is one of the best main-crop Peas I ever saw. Height 4 feet, a good cropper, all the pods well filled. In favour equal to Vetch's Perfection. Here we have a Pea which has long been sought after."

SUTTON'S DUCHESS of EDINBURGH.

Price 2s. 6d. per quart.

THE BEST CAULIFLOWER.

SUTTON'S KING of the CAULIFLOWERS.

From Major DICKINS, Colchester.—"Your King of the Cauliflowers is the best I ever saw. Plants grown from the seed I got from you last year took several prizes."

Price 1s. 6d. and 2s. 6d. per packet.

THE FINEST LETTUCE.

SUTTON'S SUPERB WHITE COS.

From Mr. R. W. TOMP, Gardener to His Grace the Duke of Buckingham.—"Your Superb White Cos Lettuce is the best kind I know for summer use. No garden should be without it."

Price 1s. per packet, 2s. 6d. per ounce.

THE BEST POTATO.

SUTTON'S MAGNUM BONUM.

SUTTON'S MAGNUM BONUM POTATO.

This Potato was introduced by us two years since, and now undoubtedly ranks as the best and most useful variety in cultivation. It combines great productiveness with excellent flavour, while its power of resisting disease and late keeping properties render it invaluable both for gentlemen's and cottager's gardens, as well as for field culture. The tubers are of uniform size, of true kidney shape, with few and very small eyes, almost level with the surface; the skin is russeted, and flesh firm. The haulm is dark green in colour and very robust in growth, which enables it to withstand the disease better than any Potato with which we are acquainted. It may be cooked directly it is taken from the ground, or may be kept till other varieties are useless.

Mr. CHARLES PENNY, Head Gardener to H. R. H. the Prince of Wales, says:—
"I find Magnum Bonum the best Potato I ever ate. In flavour it is superior to any variety known."

Lowest price per sack or ton on application.

Sutton's New Cyclamen, "Giganteum Roseum."

This magnificent variety surpasses all others yet introduced. Anticipating a great demand we advise early orders.

Price 5s. per packet.

Will be ready in a few days, price 1s., post-free for fifteen stamps, or gratis to Customers.

To the Trade.—Azalea amoena Caldwellii. W. G. CALDWELL and SONS beg to offer strong bushes of this fine improved variety (which at this early season is blooming profusely), at 18s. per dozen, £5 per 100. W. G. CALDWELL and SONS, The Nurseries, Knutsford, Cheshire.

Fruit-bearing Trees. FINE STANDARD and PYRAMIDAL PEARS.—A large quantity of the above to be sold cheap, the land being required for other purposes. Inspection invited. No reasonable offer refused. All recently removed. JOHN STANDISH and CO., Royal Nurseries, Ascot, Berks.

MYROBALAN, or CHERRY PLUM, is the best stuff for Mending Old Fences or Making New Ones. It grows vigorously in the poorest soils, even where White-thorn will hardly exist, and bears clipping like White-thorn. Its stiff hard branches, and dangerous spines or thorns, effectually prevent cattle or evil-disposed persons from getting through Fences made of it. Plant from four to six in a yard. Sizes and prices on application to EWING and COMPANY, The Royal Norfolk Nurseries, Eaton, near Norwich.

ROSES, Dwarf Hybrid Perpetuals, very strong, of leading sorts, on Manetti Stock; these, being budded so low as to leave scarcely any of the stock, are admirably adapted for pots or beds; 9s. to 12s. per dozen, 70s. per 100.

YUCCA RECURVA, fine specimens, about 2 feet, 3s. 6d. each. PYRACANTHA, Red-berried, hardy plants, 1-yr., in 4-inch pots, 4 to 6 inches, 3s. per dozen, 21s. per 100. 2-yr., in 5-inch pots, 9s. per dozen. H. McMILLAN, St. James's Road Nursery, Kingston-on-Thames.

American Grown Tuberose Roots. TUBEROSE ROOTS, of my own growing, finest quality Roots, £5 per 1000. EULALIE JAPONICA VARIEGATA, £2 per 100. FRANKLENIA PUBESCENS, 2 to 4 feet, 15s. per dozen. All packed free; freight by steamer, Baltimore to Liverpool, low. JOHN SAUL, Washington, D.C., U. S. America.

Vines—Vines—Vines. J. COWAN, The Vineyard, Garston, near Liverpool, has still on hand several thousands of strong, well ripened VINES. Fruiting Canes, 10s. 6d. to 12s. 6d. each; Planting Canes, 5s. to 7s. 6d. each. Catalogues free. Trade supplied. Terms on application.

Fruit and Forest Trees, Ornamental Shrubs, SEEDS, &c. J. SCOTT, The Royal Nurseries, Merriott, Somerset, has to offer large and fine Collections of the above, in large and small quantities, and at moderate prices; all are in excellent health and well rooted. The "ORCHARDIST" price 3s. 6d. The best work on Fruit Trees and their cultivation in the English language.

TO EFFECT A CLEARANCE the following little LOTS are offered:—5000 ASH, 1½ to 5½ feet, for 150s. 5000 RHODODENDRONS, 3 to 4 ft., fine, 75s. per 100. Free into railway truck. CHARLES NOBLE, Bagshot.

Bulbs, Orchids, &c. THE NEW PLANT and BULB COMPANY beg to call attention to their new CATALOGUE of BULBOUS PLANTS, ORCHIDS, &c., in which will be found many Novelties of sterling merit, including a new White Hardy CYPRIPEDIUM, &c. CATALOGUES post-free on application, Lion Walk, Colchester.

To the Trade Only, for Cash on Delivery. DIELYTRA SPECTABILIS, strong, 20s. per 100. VESUVIUS GERANIUM, bloom splendid trusses, 10s. per gross. THOMAS KITLEY, Oldfield Nursery, Bath.

Cover Planting, &c. SAMUEL and JAMES SMITH (late J. Smith, Sen.), Tansley Nurseries, near Madock, Derbyshire, have the following quantities, viz.:—RHODODENDRON PONTICUM, 1½ to 2 feet, 20s. per 1000, 180s. per 1000; 2 to 3 feet, 20s. per 100, 180s. per 1000; 3 to 4 feet, 30s. per 100, 200s. per 1000; 5-yr. seedling, 12s. per 1000, £50 per 100,000. BROOM, 1-yr. seedling, 2s. 6d. per 1000, 20s. per 10,000; 2-yr. do., 4s. per 1000, 30s. per 10,000. GORSE, 1-yr., 2s. per 1000, 25s. per 20,000. Nursery LIST on application.

To Nurserymen and Florists. TO BE SOLD, the whole of the PLANTS now at Ravensworth House, Waltham Green, consisting of some large Camellias and Rhododendrons, Myrtles, 200 Azaleas, 200 Fuchsias, Pot Roses, Ferns, 150 Cinerarias, 130 Pelargoniums, over 4000 bedding plants, &c. Mr. Watts, the Gardener, will show the plants. For further particulars apply to Mr. HENRY WALLACE, Trench Hall, Gateshead.

WELLINGTONIA GIGANTEA, 50 fine plants, 5 to 6 feet, in large pots, 10s. 6d. each. Also 400 CEDRUS DEODARA, 10 to 15 feet, in pots, all safe to transplant, at 10s. 6d. each. A large assortment of tall EVERGREEN TREES, 8 to 10 feet and upwards, grown expressly for Screens, Blinds, and Planting for Immediate Effect. WM. MAULE and SONS, The Nurseries, Bristol.

CHARLES SHARPE & CO., SEED MERCHANTS AND GROWERS, SLEAFORD,

Beg to call attention to the following NOVELTIES :—

THE RAUCEBY HALL MELON.

This splendid new Green-fleshed Melon has been raised by Mr. Brown, the gardener at Rauceby Hall, and has during the past two seasons been exhibited seventeen times—in every case gaining a First Prize. It is hardy, a fine setter, and a very heavy cropper. The fruit is very beautifully netted, the flesh juicy, sweet, and melting, and of a very rich flavour. Altogether it is a variety of unquestionable superiority, and worthy a place in every garden.

Price, 2s. 6d. per Packet.

TESTIMONIALS.

From W. INGRAM, Esq., Belvoir Castle Gardens.

"Dear Sir,—The Green-fleshed Melon exhibited by Mr. Brown at the Sleaford Show this year, and to which the First Prize was awarded, was of exceptional excellence, having a rich flavour, and being sweet, melting, and very juicy.

"November 21, 1877.

"I am, yours truly,

"W. INGRAM."

From Mr. JAMES BROWN, Rauceby Hall Gardens.

"Dear Sir,—My Seedling Green-fleshed Melon has a very hardy constitution, it is a very free setter and immense cropper, beautifully netted, and unquestionably the handsomest and finest flavoured Melon grown, averaging from 3 to 4½ lb. in weight. I have exhibited myself several times, and it has never been beaten. You can safely recommend it to be the very best Melon ever sent out, and the entire stock is in your hands.

"November 12, 1877.

"I am, dear Sir, yours truly,

"JAMES BROWN."

From Mr. C. BILLESON, Syston Park, Grantham.

"Dear Sir,—I have tasted, and also seen growing, the Melon called Rauceby Hall Seedling, and I believe it to be a really first-class Melon, most delicious in flavour, free setter, and a very robust constitution. It is medium in size, thin rind, and very juicy. A most handsome fruit for the table.

"November 16, 1877.

"I am, Sir, yours truly,

"C. BILLESON."

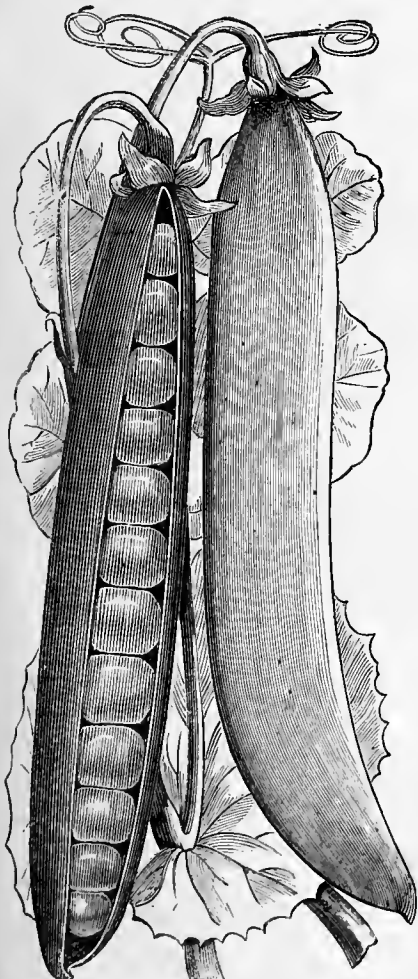

From Mr. GEORGE SANDY, Haverholme Priory, Sleaford.

"Dear Sir,—I have grown your Seedling Melon, with several other varieties, the last two seasons, and find it to be of good constitution, a very free setter, fruit of medium size, beautifully netted, handsome in appearance, and of excellent flavour. It ripens its crop off much quicker than many other varieties now in cultivation, which will make it valuable for early and late crops.

"November, 9, 1877.

"I am, yours truly,

"GEORGE SANDY."

SHARPE'S INVINCIBLE.

SHARPE'S INVINCIBLE.

NEW LONG-PODDED BLUE MARROW PEA.

CHARLES SHARPE & CO.

Have much pleasure in sending out for the first time this invaluable new main-crop Pea, which has been raised by Mr. William Culverwell, of Thorpe Perrow, who has devoted a considerable amount of skill and attention to the improvement of this vegetable.

The Invincible is a cross between Veitch's Perfection and Essex Rival, and has the advantage of being but little liable to the attack of mildew.

The plant is about 3 feet in height, of a robust branching habit. The pods are produced in pairs, and occasionally three together, from near the ground to the top of the stem—the rows having the appearance of being clothed with pods from top to bottom. The pods are closely packed with from ten to twelve large Peas, which, when cooked, are of exquisite flavour, and of a beautiful deep green colour.

As a main-crop Pea, either for the Gentleman's Garden or the Market Gardener, CHARLES SHARPE & CO. have no hesitation in saying that the Invincible Pea will be found superior to anything yet sent out.

Price, per Quart, 5s.

Half-pint Packets, free by post, 1s. 6d.

SILENE PENDULA COMPACTA, 2s. 6d. per 100.
STOCKS, Scarlet Queen, 2s. per 100.
TRITOMA UVARIA, 4s. per dozen, 28s. per 100.
 All the above cheaper by the 1000. Orders amounting to 20s. boxes and packing free.
The Nurseries, Bedford Road, Northampton.

MESSRS. CHARLES LEE & SON,
 ROYAL VINEYARD NURSERY, HAMMERSMITH,
 LONDON, W.,
 HAVE MUCH PLEASURE TO OFFER THE FOLLOWING VERY
BEAUTIFUL AND INTERESTING NEW FRUITS,
Now offered by them for the first time:—

RUSSIAN TRANSPARENT APPLE.
 In the *Journal of Horticulture*, December 21, 1876, "J., Lincolnshire," describes this valuable Apple as giving a "never-failing crop," and as being "a rent-paying tree" for cottage gardens. Mr. BEULAH, an experienced Lincolnshire Orchardist, confirmed this evidence of the usefulness and profitableness of this much neglected but desirable Apple.
 A Tree that bears a never-failing crop, of excellent quality, as stated below by Dr. HOGG, must be as near perfection as possible, and a desideratum that cannot fail to be appreciated by Orchardists in general. The Russian Transparent Apple was brought from Moscow during Napoleon's campaign in Russia, by General Boucheret, who, noticing its hardiness and free growth, and believing it would be suitable for English gardens, brought a quantity of grafts to his home in North Lincolnshire, round which it became and has remained up to this time localised; and now, through the kindness of Mr. Beulah, we have been enabled to purchase all the available grafts from the original stock.
The following is from Dr. HOGG's description:—
 "Fruit large, roundish, somewhat oblate, narrowing towards the crown, where it terminates in several prominent ridges, flat at base; skin smooth and shining, grass-green, strewed with large russet dots. Eye closed. Flesh very tender and juicy, with a pleasant sub-acid flavour, and a peculiar and agreeable aroma. I am convinced that this is one of the most valuable culinary Apples in cultivation, and is worthy of more than local fame."
MESSRS. CHARLES LEE AND SON have much confidence in introducing this desirable and profitable Apple to more extended cultivation.
Strong Maiden Plants now ready, price 7s. 6d. each.

HENSON'S SEEDLING GOOSEBERRY.
 This excellent variety was figured in the *Florist and Pomologist* for May, 1874, a First-class Certificate having been awarded to it by the Fruit Committee of the Royal Horticultural Society in 1873. It was described as "a new and distinct variety of exceedingly good quality, of the hairy red section, and a good dessert fruit of medium size."
MESSRS. CHARLES LEE AND SON having purchased the entire Stock of this valuable Gooseberry, they are now prepared to distribute it to the Public.
Price per Plant, 3s. 6d.

THE USUAL DISCOUNT TO THE TRADE.

ODONTOGLOSSUM ROEZZII.

MESSRS. JAMES VEITCH & SONS

Having recently received, in excellent condition, a large importation of this beautiful ORCHID, offer Plants at the following prices :—

Small healthy pieces	£3 0	per dozen.
Larger Plants	£6 6	„
Extra sized	£12 12	„

The Plants are very healthy, and all have been received with good foliage.

A VOICE FROM SWANLEY.
OLD AND NEW.

The old year passing so surely and steadily away, H. CANNELL embraces the opportunity of returning his warmest thanks and best wishes to patrons and friends who have kindly favoured him with their esteemed orders and visits, and assures them that it affords him infinite pleasure to gaze on the pile of testimonials before him from all parts of the world, complimenting him on the quality of Plants and Seeds, &c., supplied, and eulogising his strenuous endeavours to satisfy the public. He is also proud to say that his efforts have been crowned with success in importing his treasures into some of the remotest parts of the world, and with still further pride and satisfaction he begs to announce that, with the valuable assistance of his elder Son (who now participates in the business), great exertions have been made to meet the exigencies of the coming new year; neither money, time, nor labour have been spared to accomplish the one great aim, of supplying flower-lovers with the "choice of the choice." His Floral Guide will shortly be issued, containing plants of inestimable value, "White Vesuvius," for instance, which must be considered one of the greatest gifts to the Horticultural World; further, himself and son beg to intimate that in future

GOOD THINGS.

will be announced at intervals, and all the best novelties of the season sent by post, so that both amateurs and nurserymen in the most secluded parts can be as well supplied with any varieties of plants as those residing in or near London. As the time could not be more *apropos*, himself and Son take the liberty of wishing the compliments of the season to all, and in conclusion trust to a continuance of the kind favours hitherto received, which they will strive to deserve by their unquestionable alacrity and attention.

Swanley, Kent.

GALLOP'S MIGNONETTE PRIZES.

F. GALLOP, SEEDSMAN & FLORIST,
30, WESTERN ROAD, BRIGHTON,

Introducer of MILES'S NEW HYBRID SPIRAL MIGNONETTE, will offer, through the Royal Horticultural Society, South Kensington, at their GREAT SUMMER SHOW, announced to take place in MAY NEXT, THREE MONEY PRIZES, to be paid on the First Day of the Show, for TWELVE PLANTS of the above-named MIGNONETTE, to be grown in 6-inch pots.

1st Prize, £10. 2d Prize, £7. 3d Prize, £5.

Seed now ready, 2s. 6d. per Packet.

My CATALOGUE of the above and other CHOICE SEEDS, for which my firm have long been celebrated, will be published on January 1 next, and may be had post-free on application.

EXTRACT from the "JOURNAL of HORTICULTURE and COTTAGE GARDEN," JUNE 7, 1877.

"This is the finest Mignonette that has come under our notice. It is the same variety that attracted the attention of Her Majesty the Queen at the great Exhibition at South Kensington, on May 2, 1877."

The following Nurserymen and Seedsmen have already secured a supply of Seed,

HARDY TREES AND SHRUBS.

MESSRS. J. VEITCH & SONS

Beg to call attention to and solicit an inspection of their fine and extensive stock of all the most useful Ornamental Hardy Trees and Shrubs, at their Nurseries, Coombe Wood, Kingston Hill.

CONIFERS.

A most complete collection, many of the species and varieties being of their own introduction. Specimens for Lawns, Parks, and Pleasure Grounds. All the kinds suitable for every purpose for which this class of plant is required.

AMERICAN PLANTS.

RHODODENDRONS, AZALEAS, KALMIAS, ANDROMEDAS, HARDY HEATHS, &c.

An exceptionally fine stock of healthy plants, especially recommended as being dwarf, compact, and well set with buds, and in fine condition either for forcing or for pleasure-ground planting.

EVERGREEN SHRUBS.

All the leading kinds, also many rare and choice species of very distinct character, forming a new feature in the Shrubbery. A very large stock of Standard, Pyramid, and Bush Greeno, Gold, and Silver Variegated Hollies, in great variety and of various sizes.

DECIDUOUS TREES and FLOWERING SHRUBS.

A very extensive collection, including all the best known kinds, with many novel and interesting varieties. Japanese Acers, Weeping Trees, and other Trees and Shrubs with Variegated and Coloured Foliage.

FOREST TREES,

For AVENUES, BELTS, PLANTING, &c.

All the most desirable kinds. Plane, Chestnut, Elm, Lime, Birch, Oak, Maple, and Larch; Pines, Firs, and Cedars.

ROSES.

Strong healthy Plants as Standards, Half-Standards, and Dwarfs, of all the best varieties of Hybrid Perpetuals, Tea-scented and Noisette Roses, Moss, Climbing, and other kinds. An extensive stock in pots of all the best Roses suitable for Forcing, &c.

PLANTS for WINTER BEDDING.

Conifers, Retinosporas, Junipers, Lawson's Cypress, &c., in many variegated and beautiful forms; Euonymus and Dwarf Hollies, both Silver and Golden Variegated, in many varieties. Aucubas, Ericas, Dwarf Rhododendrons, &c.

PLANTS for FORCING.

All the most useful and effective, including Andromeda floribunda; Azalea amona, pontica (yellow, sweet-scented), and Belgian varieties; Clematis in variety, Deutzia gracilis, Lilac Charles X. and Persian, Double Chinese Prunus, Rhododendrons, R. Early Gem, very superior; Rhodora canadensis, very early; Spiraea Thunbergii.

CLIMBING PLANTS,

Well established in Pots.

Clematis, a very extensive collection of all the leading kinds, and of Garden Hydrangeas. Ivies in great variety. Fine healthy Plants of the free flowering Exmouth variety of Magnolia grandiflora, Honeysuckles, Jasmines, Ampelopsis, &c.

A CATALOGUE

OF

Hardy Trees and Shrubs, Ornamental Grasses, Hardy Aquatics, &c.,

Will be forwarded on application.

The Nurseries at Coombe Wood may be reached from the Malden and Norbiton Stations on the South-Western Railway, being not more than twenty minutes' walk from the latter, and where conveyance can always be procured.

Royal Exotic Nursery, King's Road, Chelsea, LONDON, S.W., And Coombe Wood, Kingston Hill.

Now ready, new and enlarged Edition of

WEBBS' SPRING CATALOGUE:

Beautifully Illustrated with a large number of splendidly executed Engravings and Chromo-Lithographs, and containing Complete Instructions for the successful Cultivation of the

BEST VEGETABLES and FLOWERS

Also, Calendars of Operations for the Kitchen and Flower Gardens, with a Select List of Choice Vegetable and Flower Seeds, Potatos, Bulbs, &c.

ALL WHO HAVE A GARDEN should send for

Post free 1s. Gratis to Customers.

The best work on Gardening matters yet published, which will be found invaluable to the Amateur as well as the Professional Gardener.

Extract from Opinions of the Press.

"A most excellent specimen of the modern seed list and horticultural guide to successful cultivation. We have gone carefully through the calendars of operations, and find them comprehensive, plain, full, and thoroughly trustworthy."—*Midland Counties Herald.*

"A publication of remarkable beauty and interest. The book is one of the best works on gardening that has yet appeared."—*The Magnet.*

"This catalogue is well got up with an illuminated cover and coloured plates of flowers executed in the best style of chromo-lithography. It also includes some hundreds of first-class engravings, illustrating the superior flowers, vegetables, potatos, &c., offered by this eminent firm. In addition to the valuable notes on the cultivation of the various vegetables, we noticed a calendar of operations in the kitchen and flower gardens, giving complete instructions, in a very concise form, and profitable hints as to the growth of flowers, of which the coloured and other drawings represent many new and choice varieties."—*The Farmer.*

All Goods of 20s. value and upwards Carriage Free. FIVE PER CENT. DISCOUNT FOR CASH.

The Queen's Seedsmen, WORDSLEY, STOURBRIDGE.

CHRISTMAS!

FOLIAGE PLANTS FOR DECORATION.

THESE, if they do not rank so high in decorative value as flowers, which we spoke of last week, yet have their uses, and are made to play important parts at Christmas. Some of them, as, for instance, the Dracænas, Pandanus Veitchii, Crotons, and others, combine the hues of flowers in their richly-marked foliage, and make bright and winsome our dwellings and plant-houses when dulness and dreariness abound in the landscape, and the sun fades away—dwindles away to nothingness—soon after midday,

"when with a gust
Old Winter tumbles shrieking from the hills,
His white hair blowing in the wind!"

The play of light and shade on Fern-frond and Palm-leaf, and the fresh green hue of Ficus and Cyperus, among others make spring perpetually present. The year for the market-grower is one long spring and summer from January till December. Autumn and winter are seasons that have passed out from the calculations of time.

The DRACÆNA is now being sent to market. The two favourite market plants are terminalis among the coloured-leaved section, and rubra among the green-leaved varieties. Mr. H. B. Smith, of the Ealing Dean Nursery, who makes a specialty of Dracænas, sends to market during the winter and spring some 3000 plants of terminalis. They are perfect examples when 20 inches or so in height in 48-pots, the young leaves richly coloured like a rosy vermilion blade. Cooperi is grown, and is very pretty, but it does not stand like terminalis, as the flashes of colour in Cooperi appear to be delicate and quickly fade; it is, therefore, necessary to send it to market just when it is at its best. Rubra has a good stocky character of growth, and it is also elegant in appearance.

Dracænas are propagated all the year round. Propagating pits are ever centres of activity. The stems of plants are cut up in inch lengths, each containing a circlet of eyes, and from these eyes two and three and five and six shoots will spring, and directly there is a sign of a root being put forth, and even before, they are put singly in thumbs and plunged in a brisk bottom-heat, where they soon grow away into size. The tops of the plants are put into small pots in fresh cocoa-fibre—it must be fresh, and not that previously used—and these make handsome plants in two or three months. Plants from eyes attain a size of from 18 to 24 inches in twelve months. It is interesting to know that the green-leaved Dracænas are slower to propagate than the variegated-leaved varieties—such is the testimony of Mr. Smith. At Ealing Dean the great bulk of the propagating is done by the middle of March. What charming plants Mr. Smith is now sending to market! The price they fetch is a capital indication of their merit. Dracænas are kept fully moist in autumn, but in winter, when the days are short and the weather dull, they require to be kept drier, or damp will injure them. The houses in which they were growing are comfortably warm, nothing more.

PALMS in a young state are much sought for as decorative plants in winter and spring, and indeed at all seasons of the year. The favourites are Latania borbonica, Corypha australis, Areca lutescens, Scaforthia elegans,

Ptychosperma Alexandræ, and *Phoenix reclinata*. These are bought on the Continent from the seed pots. They are got over in October and November, turned out of the seed pots, and the balls of soil secured in moss, and there are from twenty to fifty plants in a pan or pot according to their size. When received, the plants are potted singly into small pots and plunged in bottom-heat. A few of the foremost will be ready for market the following autumn, but the main portion in the spring succeeding. They are sent to market chiefly in 48 and 32-pots according to their size, and when growing cannot well be too moist, provided there be a fair heat. When fresh potted, Palms should have bottom-heat to induce them to start quickly into growth. Some cultivators of Palms import their seeds and sow them in this country, if they have the command of resources from which they can obtain supplies likely to germinate. Those who do not enjoy this advantage import plants in seed pots as previously set forth.

Pandanus Veitchii will make a capital market plant when it becomes plentiful enough to be produced in quantity. Small plants in 48-pots take on a charming variegation, and nice plants in 48 and 32-pots are likely to be in considerable demand. It can be had in market size in the space of twelve months from cuttings. Quite young plants throw up suckers round the main stem, and they are taken off constantly and struck in the same way as *Dracænas*, but require a little more care to prevent them rotting off. Silver sand appears to be the best soil for striking, and it reduces the chances of loss from rot.

FERNS are grown by the thousand in the market nurseries. The name of the marketable forms is legion; those of a few may, however, be set down:—*Pteris serrulata*, *serrulata cristata*, and *cristata grandifolia*, the last-named being a fine and handsome form; *P. argyræa*, *cretica*, and *cretica albo-lineata*; *Nephrodium molle*, and *molle cristatum*; *Adiantum cuneatum*, *trapeziforme*, *formosum*, *scutum*, and *pubescens*; *Lomaria gibba*, *Phlebodium aureum*, *Blechnum corcovadense*, and *brasiliense*; *Nephrolepis exaltata* [? *tuberosa*], &c., the last-named being very popular.

The Ferns are raised in immense quantities from spores. The spores are sown in September and October in 48-pots, well drained and filled with a light peaty soil, and the spores laid on the surface. The pots are then put under bell-glasses, as they do so much better in consequence, germinating not only more freely, but much more quickly. The surroundings are quite moist on a brisk bottom-heat, but as far as possible moisture is not allowed to cover the spores. A little fine mortar rubbish to cover the surface is used in some cases with great advantage. When germination has taken place the embryo plants are taken out in little patches, and pricked out into other pots, and when an inch in length they are potted off singly into small pots to grow on. All the *Gymnogrammas* are much grown, but they are bad doers during winter in a seedling state, and have to be watched with close attention.

Very large quantities of these Ferns are sent to market in April in thumb-pots, when the plants are some 3 inches in height, when they find a ready sale. Those that have grown on till they are put into 48-sized pots are sent to market in June and July.

Adiantum farleyense is largely and most successfully grown by Mr. H. B. Smith. As no seed of this is forthcoming, it is propagated by division of the plants, which are cut up in winter and spring—the best periods of the year, as they grow so much quicker. This fine Fern is marketed all through the year, and especially just now; plants in 60-pots being in admirable condition.

The Fern-houses at the Ealing Dean Nur-

series are remarkable structures; they are sunk down low in the earth, and are reached by means of a descent of three or four steps, and there is just about room for a man of middle height to stand upright in them in the centre of the span of the roof; but they are admirably adapted for Ferns, and grow them excellently well.

CROTONS are a capital market plant just now, and of these *pictus* and *variegatus* are the best and brightest looking; *C. Weissmanni* will also make a capital market plant when the stock becomes more plentiful. *C. pictus* colours finely in 48-pots in an intermediate house at this season of the year; but they are scarcely in season yet as far as the order of market work is concerned.

ASPIDISTRA LURIDA, and *variegata* also, the latter especially, are excellent market plants, and the latter, when rightly grown, comes handsomely variegated. No plant is better adapted for a living room; it will bear a dry atmosphere, dust deposits, and gas with little apparent harm, and will retain its freshness for a long time if the leaves be occasionally sponged. It is propagated by cutting up the roots in spring—just as winter is giving place to spring—and when placed in bottom-heat soon starts into growth and makes plants.

Such are a few of the foliaged plants grown for service at the Christmas season. What activities are put into operation, and what results flow from them! Plant growing for market deserves a foremost place in the annals of practical horticulture, and the words of the Oriental sage might be aptly applied to the worker-out of these extraordinary results—

"There is in thy soul a certain knowledge."

R. D.

New Garden Plants.

CYPRIPEDIUM BOXALLII, *Rehb. f., supra, March 24, 1877.*

How quick is the progress of the knowledge of plants now when compared to the time twenty years ago. It was March 3, 1877, when Mr. Stuart Low, my oldest English Orchidic correspondent, sent me the first materials, all that he had, two dried flowers and a stretched sepal and petal, and some remarks of its discoverer, Mr. Boxall. After having meditated a few days, I named and described the new *Cypridium* without the least hesitation on March 12. It appeared in these columns on March 24. Its London *jour de fête* at Mr. Steven's was March 29. We hear, undoubted well-founded complaints, that sometimes there are *quid pro quos* in nomenclature, whether *bona* or *mala fide* is the question, but our plant had the opposite fate. Proposed as a new thing, it was declared by somebody to be the old *C. villosum* (I believe easily distinguishable by its longer leaves) and in consequence it was paid for as old *villosum*. Such cases may be regarded as the counterbalance of the mistakes we have just alluded to. May 9, I had by Mr. Low's kindness a few words from Mr. Boxall—no doubt sent from the warmer parts of Asia. In autumn I purchased a good healthy plant from Messrs. Jacob-Makoy, and now early in December I have from Mr. Low a single fresh flower and a flowering plant, with its great roots and three breaks. I regard it quite an unusual pleasure to see the lovely plant in the best flower. The peduncle is shorter than in *Cypridium villosum*, more in the way of that of *C. insigne* and *Druryi*, with many small violet-brown streaks, and brown and white not very dense hairs. The sheathing bract appears to be subject to many variations in length. It always occurs only half as long as the ovary, of a very vivid green, such as is more often seen in minerals than in plants, and with numerous small blackish spots at its base. The remarkably short thick ovary is covered over and over with dense ascending hairs, not quite so long as those of the old *Cypridium villosum*. I cannot help thinking of a goat's wintery hair dress when I see these ovaries. The flower is as large as that of a good *Cypridium insigne*, smaller than that of *C. villosum*. The upper sepal is of a beautiful, uncommonly fresh light green, with a narrow white border, covered with brownish-black spots, which are confluent in the disc in hieroglyphic figures up to the apex. There are small short hairs around the border, and some bristles outside, chiefly over the keel of the middle vein. All the inside looks as if just most carefully varnished, shining like a looking glass. Its outside is lighter

green and there is a dark hue at the place where the spots stand underneath. The inferior sepal is oblong acute, shorter than the lip, bidentate at its apex, light green, with lines of very small reddish-brown spots, which are far more conspicuous outside; there is no varnish. The petals are very broadly cuneate at the base, dilated at the apex, blunt, with one or two undulations on the superior border and with numerous small hairs outside; their ground colour is a light green. A dark rather broad bluish-violet line runs from the base of middle line up to near the apex, bearing here and there some little prominences. The superior half shows the longitudinal nerves covered with cinnamon spots, most distinct and dark at the base, more and more confluent in the middle part, and nearly forming one great brown blotch near the top. The inferior part is very different, showing rows of angulate blotches nowhere confluent. Thus both halves appear quite different as to colours. The whole surface is beautifully varnished inside. The outside is pallid green, with light brown on both borders and over the central line. The lip chiefly forms a blunt conical sac with two channelled upright horns and a channelled claw. It is greenish-yellowish with dense rows of cinnamon spots under the orifice of the sac. The staminode is rather sagittate triangular, and bears a compressed triangular body before its apex in the middle line. It is obscurely three-lobed at its retuse apex, and full of warts on both sides. There are dark stiff hairs at its base.

The mixture of these blotches of several colours and various forms and different combinations on very distinct ground colours of unusual gay tints gives an extraordinary character to our good Benjamin of *Cypridium*. It may be said to be amongst the *Cypridia* what *Cœlogyne Schilleriana* and *Hookeriana* are amidst the *Cœlogyne*, the *enfant chéris* of creation. As a species it can only be compared to *Cypridium villosum* which is much taller, has a much larger flower, with the upper sepal very narrow at base and generally nearly hastate-dilated, its petals with narrow claws and then much broader towards the top, the inferior sepal far more acuminate, the lateral horns of the lip much longer. *Cypridium insigne*, *Druryi*, *hirsutissimum*, are all alike in the superior sepal not being unguiculate, all different by the various, most distinct hairs of the ovary, and then each species has its own discrepancies which it would be too long to enumerate. There exists no other species one could compare with these.

Investment of money in *Cypridium* is most decidedly one of the safest in the exchange of orchidists. Very often you may earn a hundred and more per cent. by getting two or three plants of one in a year. It needs no very acute prophecy to predict that this lovely Christmas flower will become a beloved friend to all orchidists. It may serve to remind us of Mr. Stuart Low's keen enterprise, founded on a wonderful knowledge of so many districts of the globe and of Mr. Boxall's unusual successes, which have afforded so many lovely contributions to orchidology. *H. G. Rehb. f.*

THE FLOWERING AND FRUITING OF THE HOLLY.

THE Holly affords a striking illustration of the knowledge that may be gained by a minute study of common things. It is so well known to us, so near, so familiar, that we do not inquire into its structure or life history, for indeed what have we to learn? It is a hardy evergreen tree that sometimes bears red berries in great profusion, and in seasons when it fails to bear berries, we conclude that the weather was unfavourable in the previous month of May. It does not readily or obviously occur to any one that the fruiting of the Holly may depend on the bustling of some little fly amongst its flowers at the very moment when the pollen is ripe. Nor, if it be observed that some Hollies are fruitful and others barren, does it readily appear that this difference is in no way the result of accident, but is in accordance with a law—for to come to matters of fact, Hollies are, like bees, of three genders, males, females, and neutrals. Of the last indefinite section there may be room to doubt, as will be explained presently; but of the distinctly sexual character of the majority of Hollies there can be no doubt at all, for an examination of the flowers will enable any one competent to such a task to predicate which will prove the barren and which the fruitful trees. The Holly is usually dioecious, but there are, probably, hermaphrodite varieties, and there are, probably, some that never flower at all, and are absolutely incapable of reproducing themselves by seeds. This subject is full of interest, as will be discovered by any one who will devote a little time to investigating the structure of the flowers of the more prominent varieties, for the males and females are easily distinguished, and the flowers vary in form considerably.

As a matter of course the subject has not utterly escaped the botanists. Withering says, "Great variations take place in the flowers of the *Ilex Aquifolium*, sometimes the stamens and pistils are found on distinct plants, sometimes on the same plant, but in different flowers; sometimes, again, the flowers have five stamens; and frequently there are male and female, as well as hermaphrodite flowers on the same, or on different plants (*British Plants*, 1801). Sir J. E. Smith (*English Flora*, 1824) makes no reference to the subject. Dr. Deakin (*Florigraphia Britannica*) is equally silent. Bentham (*Handbook of the British Flora*) ditto. Hooker says, "Flowers white, often subdicoecious" (*Student's Flora*). Mr. Darwin says, "In the several works which I have consulted, one author alone* says that the Holly is dicoecious. During several years I have examined many plants, but have never found one that was really hermaphrodite. I mention this genus because the stamens in the female flowers, although quite destitute of pollen, are but slightly and sometimes not at all shorter than the perfect stamens in the male flowers" (*Different Forms of Flowers*, p. 297). I have italicised a very important observation, which I think will prove to be only partially true, for not only may we find perfect stamens in female flowers, but it is highly probable that such are truly hermaphrodite, and are fertilised by their own pollen.

The subjoined figures represent flowers of Hollies selected from a good collection in the month of May, 1877. It will be observed that the prevailing character is a wheel-shaped corolla of four petals containing (in the male) four globose anthers on stout radiating filaments or (in the female) no stamens, but a prominent ovary bearing four stigmas. In an examination of some hundreds of flowers comparatively few were found with five divisions, but many with more or less than four.

No. 1. A female, was taken from a seedling plant of the common green-leaved *Ilex Aquifolium*. All the flowers on this plant were fashioned as in the figure, with from eight to ten petals and a prominent ovary. The berries that follow are clavate, or incline to a pyriform outline, and have three or four deep sutures radiating from the umbilicus to about half the depth towards the stalk. [Query, is not the outer series a calyx?]

No. 2. A female, contains three supplementary petals [staminodes], which may be regarded as stamens transformed.

No. 3. A female, has six shell-shaped petals delicately suffused with rosy purple.

No. 4. A male, is typical every way, and calls for no remark.

No. 5. A male, is equally typical except that it is thrice divided.

No. 6. A female, is thrice divided, and has three supplementary petals, which, by their mode of insertion, appear not to be transformed stamens.

No. 7. A female, is a possible replica of No. 2.

No. 8. A hermaphrodite perhaps. Here, indeed, the stamens appear abortive, but I am persuaded that I have seen flowers bearing globose anthers well furnished with pollen, and also perfect ovaries. As to the last I can vouch, because I have marked them and seen the berries swell.

In classifying the hollies with reference to their sexual characters, we may make four classes—1 males, 2 females, 3 hermaphrodites, 4 non-flowering. The third class remains to be established on scientific evidence; and the fourth is in the position of a negative that no one can prove. To say that a plant of any kind never flowers is to violate common sense. If we could live long enough we might see it flower, and, irrespective of the element of time, while it may not flower in one place it may in another, and even then escape the observation of such as would understand and record the event.†

To entertain doubts on such matters is pardonable, seeing that, in respect of matters that may be determined with certainty and without difficulty, the authorities disagree. In respect of the flower, for example, there prevails a heresy that it is quinate, whereas it is quartate in its divisions, it being a most rare event to find a flower with five petals. Parkinson does not mention the Holly in his *Paradysus*, but in

his grand *Theatrum Botanicum*, 1640, there is at page 1,486 an excellent description, accompanied with accurate figures of smooth-leaved and prickly-leaved varieties, with their flowers and berries. There are six flowers shown, five of which have four petals, and one has three. Mr. Fitch's figure in Bentham's *British Flora*, p. 553, represents a four-petalled hermaphrodite flower, and a four-petalled flower of doubtful sex with three short stamens.

In respect of the fruit it is usually described as round, but the normal form is ovate or elliptical; and a somewhat common variation is that of the clavate or pyriform berry sutured from the umbilicus, to which reference is made above in the description of the flower No. 1. The tree from which this flower was taken is a common green Holly of remarkably fine growth, the produce of seed sown in 1859. Its flowers are uniformly eight petalled, and its berries are larger than the average; in form obtusely clavate and distinct, and deeply sutured. I have seen examples of the yellow-berried Holly (*lutea*) bearing berries of large size and deeply sutured, but they were rounder than those of my plant, which, for the sake of distinction, I have named *claviformis*.

The number of seeds contained in the berries is described as averaging three to five. There should be four, of course; but two is the prevailing number of bard vital carpels, the other two being abortive or invisible.

A question of some interest arises out of my own observations of Hollies in respect of the constancy of individual plants in respect of sex. Having a number of seedlings of various ages always under observa-

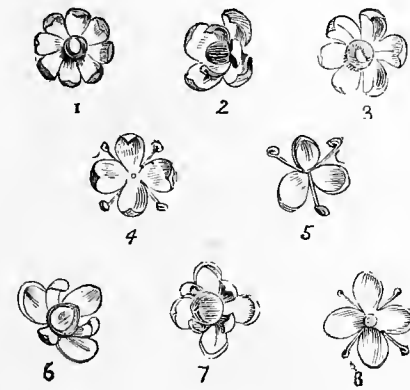

FIG. 149.—VARIOUS FORMS OF FLOWERS OF THE COMMON HOLLY (*Ilex Aquifolium*).

tion, it appears to me that they change their sex with age; that is to say, when as young plants (say about fifteen years old) they begin to flower they appear to produce male flowers chiefly. As time goes on they produce fewer males and more females, until, when they have acquired considerable size and age, they produce female flowers in very large proportion, a majority of the trees being females exclusively, and dependent on a very few males for fertilising pollen. These remarks apply to the typical *Ilex Aquifolium* only. The garden varieties have more distinctive sexual characters, as they have more distinctive styles of growth and foliage.

The varieties differ to an immense extent in their manner both of flowering and fruiting. The males for the most part flower profusely; but there are exceptions to this rule. The most floriferous of all the garden Hollies is *laurifolia*, a tree with neat, smooth, dark-green leafage, producing in the season a perfect sheet of foam-like flowers, which emit a delicious spicy fragrance. There are two or three female varieties with leafage similar to this decided male. Thus *Fisheri*, which bears a few berries, and *femina*, the most fruitful of all in every season and every aspect, may be easily mistaken for *laurifolia* when the birds have eaten the berries, and they are hastily judged by leafage alone. Every classification of Hollies must be imperfect more or less, for although we assume the species, as a whole, to be dicoecious, we may find individuals that are decidedly monoecious; and, in fact, there may at times be found on the same tree perfect male flowers, perfect female flowers, and others that are hermaphrodite in various degrees, as, for example, with distinct stigmas and stamens destitute of pollen,

or with distinct stigmas and only one stamen, and that perhaps conspicuously poliniferous. These vagaries are not confined to the garden varieties, for common seedling *Aquifolium*s exhibit them in every imaginable degree; and when seedlings first begin to flower, when about fifteen years old, they produce more male than female flowers, the case being reversed as times goes on—hence the fruitfulness of ancient Hollies, some few of which, however, are males all over, and produce no fruit at all.

In the following list garden names, good or bad, are taken as they come. Therefore, wherever Hollies are correctly named, the accuracy of the list may be tested in the garden. The female varieties have been verified by appeal to the splendid collection of Hollies in Messrs. Veitch & Sons' nurseries at Coombe Wood, Kingston:—

<i>Male-flowered Hollies.</i>	
ferox, or Hedgehog	Silver Queen
Gold, few spined	Doningtonensis
longifolia aurea	heterophylla
Smithiana	laurifolia
<i>Female-flowered Hollies.</i>	
g Denotes green leaves; v denotes variegated leaves; x denotes a plentiful production of berries.	
angustifolia, g	Hodginsii, g
angustifolia aurea pendula, v	latifolia aurea, v
angustifolia medio picta pendula, v	lutea, g x
balearica, g x	maderensis, g
Broad Leaf, v	maderensis nigrescens, g
Dark Shoot, v	maderensis variegata, v
Fisheri, g	myrtifolia, g
flava fructu aureo, g x	Milkmaid, red berry, v
femina, g x	Milkmaid, yellow berry, v
Golden Milkmaid, v	Moonlight, v
Golden Queen, v	Perry's Weeping, v

balearica	

Shirley Hibberd.

PLANT PORTRAITS.

ABUTILON LEMOINEI, *Floral Magazine*, t. 287.—A handsome seedling Abutilon, with palmate leaves and long-stalked bell-shaped flowers of considerable size and primrose-yellow colour. Raised by M. Lemoine.

ADIANTUM CAUDATUM, Linn., *Flore des Serres*, t. 2298.—A well-known stove Fern with elongate pinnate fronds, the pinnæ semilunar, sharply toothed, decreasing in size upwards, and ultimately terminating at some distance from the naked thread-like end of the rachis. Native of tropical Asia.

× ALOCASIA SEDENI, *Illustration Horticole*, t. 292.—A well-known hybrid between *Alocasia metallica* and *Lowei*, raised by Mr. Seden in the nurseries of Messrs. Veitch. The leaves are cordate ovate, shortly acuminate and petlate, dark olive green on the upper surface, where the ribs are very prominent; the under surface is reddish.

ALLOPLECTUS PELTATUS, Oliv., *Botanical Magazine*, t. 6333.—A remarkable Gesneriad with opposite glabrous leaves, one of each pair being small (1–2 inches long), the other 6–9 inches long, about 2 inches wide, oblong, shortly acuminate, rounded and petlate at the base, and raised on a stout foot-stalk 1–2 inches long. The flowers are in axillary tufts, each flower about 2 inches long, with a calyx of five lanceolate bright red sepals and an irregularly funnel-shaped corolla of whitish colour, with the limb divided into five roundish fimbriated lobes. Collected in Costa Rica by the late M. Endres, and introduced by him to the nurseries of Messrs. Veitch.

ALSTRÖMERIA PELEGRINA, *Flore des Serres*, t. 2295.—A well-known old garden favourite, concerning which the editor, M. Planchon, tells us that the word "pelegrina" signifies in Spanish beautiful, hence the name given by the Spaniards in Peru to this plant. Pelegrino in Italian, like the French *pelegrin*, signifies pilgrim, and peregrino means pretty, while in Spanish pelegrino means beautiful, and peregrino pilgrim!

ARAUCARIA EXCELSA, R. Br., *Flore des Serres*, t. 2304-5.—A fine illustration of the ripe cone and seeds of the noble Norfolk Island Pine.

BARROTTIA (PANDANUS) PANCHERI, Brongn., *Illustration Horticole*, t. 288.—A new species of Pandanus received by M. Linden from New Caledonia. The

* Vaucher, *Hist. Phys. des Plantes d'Europe*.
† The danger of a negative proposition is illustrated in Sir Joseph Hooker's description of *Hedera Helix* (*Student's Flora*, p. 172). He says, "The small sylvestral form never flowers." If he will plant it against a tower and let it climb to the top, he may see it flower within fifteen years.

leaves are arranged in tufts, are linear lanceolate, 3-6 feet long, in form denticulate at the edges, and traversed by three ribs, each provided with small spines.

BLANDFORDIA FLAMMEA VAR. **PRINCEPS**, *Flora des Serres*, t. 2314.—A noble variety, figured lately in *Botanical Magazine*, t. 6209.

CAMELLIA MADAME VERSCHAFFELT, *Revue de l'Horticulture Belge*.—A beautiful variety with very regular flowers, the petals of good substance, white flushed with salmon colour, and striped with longitudinal stripes of carmine.

CHEROPHYLLUM ROSEUM, M. Bieberstein, *Gartenflora*, t. 915.—A pretty umbellifer, with very finely cut leaves, and umbels of pink flowers. Native of the Caucasus and hardy in cultivation.

CÆLOGYNE SCHILLERIANA, Rehb. f., *Flora des Serres*, t. 2302.—A dwarf species with small pseudo-bulbs, oblong lanceolate leaves tapering to a stalk, and solitary flowers 3 inches in length; sepals and petals yellow lanceolate; lip oblong, contracted in the middle, expanding into a roundish two-lobed lamina marked with regular purplish blotches. Moulmein.

CRINUM BRACHYNEMA, Herbert, *Flora des Serres*, t. 2303.—The sweet-scented white flowers resemble those of the Eucharis, but have no corona or cup. The figure is copied from *Botanical Magazine*, t. 5937. Native of Bombay.

CROTON (CODIÆUM) LYRATUS, Lind. et André, *Illustration Horticole*, t. 293.—A curious form with obovate leaves, contracted above the middle into an oblong lobe, about half the length and breadth of the basal portion. The leaves are green traversed by a yellow midrib and lateral veins. M. Linden.

CUPHEA ROEHLII, *Revue Horticole*, December 16, 1877. Judging from the figure, this is a novel and striking undershrub, with lanceolate leaves and dense panicles of curved cylindrical flowers, scarlet and orange in colour. Mexico. Introduced by Roehl. Distributed by M. Charles Huber, of Nice.

×CYPRIPEDIUM HARRISIANUM, Rehb. f., *Flora des Serres*, t. 2289. See *Gardeners' Chronicle*, 1869, p. 108.

DAPHNE BLAGAYANA, Freyer, *Flora des Serres*, t. 2313.—A shrubby Daphne, native of Styria, with glabrous lanceolate leaves, and dense heads of white tubular fragrant flowers. It flowers in April, and would probably form a good plant for forcing. The figure was taken from a plant in M. Van Houtte's nursery.

DIPLADENIA MARTIANA, A. D. C., (CRASSINODA, *Hort.*) *Flora des Serres*, t. 2310.—A stove creeper, with oblong-lanceolate leaves, and pretty rose-coloured flowers. It is an old friend, but nearly superseded by newer and more showy species, and should be called D. Martiana. See *Gardeners' Chronicle*, 1870, p. 109.

ERANTHEMUM CINNABARINUM, Wall., *Gartenflora*, t. 916.—A species with ovate lanceolate acuminate leaves, and loose panicles of reddish pink flowers. Native of Martaban.

ERANTHEMUM LAXIFLORUM, A. Gray, *Botanical Magazine*, t. 6336.—A handsome stove undershrub, with ovate-oblong glabrous-stalked leaves, tapering at both ends, and terminal panicles of purplish flowers, each about 1½ inch long, and nearly as much across the flat five-lobed limb. Native of the new Hebrides, whence it was introduced by Messrs. Veitch.

EUCOMIS PUNCTATA, Ait., *Flora des Serres*, t. 2307.—A well-known greenhouse bulb, noteworthy for its crown of green bracts above the flowers. Cape of Good Hope.

FUCHSIA MISAI, REMOR, and TATLO, *Flora des Serres*, t. 2301.—Three varieties raised by M. Coene, of Ghent; all very double flowers, with reflexed scarlet sepals, and purple petals more or less blotched with red.

GLADIOLUS ECKLONI, Lehmann, *Botanical Magazine*, t. 6335.—A dwarf habited species, with relatively small flowers of a whitish colour, copiously sprinkled with small pink spots. Native of South Africa, whence it was originally introduced by Mr. Thomas Cooper.

GRAMMATOCARPUS VOLUBILIS, Presl, *Flora des Serres*, t. 2300.—A plant described by Don as *Scyphanthus elegans*. It is a climbing plant allied to *Loasa*, with palmately divided leaves, and yellow flowers with ten pouches. It is a native of Chili, and too rarely seen in our gardens.

HELIPTERUM EXIMIUM, D. C., *Flora des Serres*, t. 2312.—Introduced in 1793 from the Cape, this

remarkable everlasting claims notice for its lanceolate leaves densely covered like the stem with white down, and for its globose flower-heads covered with rose-coloured overlapping bracts.

HEPATICÆ ANGULOSA, D. C., *Flora des Serres*, t. 2306.—A fine species, native of Hungary, at one time thought a mere variety of *H. triloba*.

LILIUM NEILGHERRENSE, Wight, *Botanical Magazine*, t. 6332.—A noble white Lily, closely allied to the Japanese *L. longiflorum*. Figured in *Gardeners' Chronicle*, 1876, vol. vi., p. 332.

LIMATODES ROSEA, Lindl., *Flora des Serres*, t. 2294.—A well-known and charming rose-coloured Orchid, which in the hands of Mr. Dominy has, in the establishment of Messrs. Veitch, given rise to a fine hybrid with *Calanthe vestita*. Native of India.

LINARIA TRIORNTIOPHORA, Willd., *Flora des Serres*, t. 2297.—A fine old garden plant with large purple flowers in groups of 3, the long spur with which each flower is provided giving the bird-like appearance whence the name is derived.

LINUM PUBESCENS VAR. **SIBTHORPIANUM**, *Flora des Serres*, t. 2299.—A very pretty species, with lanceolate ciliated leaves, and large rose-coloured flowers. Native of Cilicia.

OLEARIA HAASII, *Revue de l'Horticulture Belge*, Nov., 1877.—A coloured figure of this very ornamental hardy shrub, first introduced to the notice of horticultural readers in our columns 1872, p. 1195.

ONCIDIUM MARSHALLIANUM, *Floral Magazine*, tab. 285.—One of the finest of the yellow *Oncids* with large flowers; sepals and petals yellow barred and spotted with brown; lip roundish, 1¼ inch in diameter, clear yellow. Brazil. Figured from a specimen in Mr. Bull's collection.

ORCHIS FOLIOSA, Soland., *Flora des Serres*, t. 2308.—A native of Madeira, occasionally seen at our exhibitions, and always with pleasure. M. Planchon is under the impression that it needs the protection of a frame or greenhouse in this country, but if sheltered and taken care of, it thrives out of doors.

PEACH EARLY ALFRED, *Florist*, December, 1877.—One of Mr. Rivers' seedlings from Hunt's Tawny Nectarine, and with white melting richly flavoured fruits of medium size, globose form, and rich colour next the sun.

PEACH MAGDALA, *Florist*, December, 1877.—A medium-sized fruit of a straw yellow colour flushed with crimson. Flesh greenish white, melting, separating freely from the stone, and of rich flavour. The leaves have reniform glands. Raised by the late Mr. Rivers from Rivers' Orange Nectarine.

PEAR LOUIS CAPPE, *Bulletin d'Arboriculture*, p. 337, 1877.—A seedling from Doyenné d'Hiver, and like its parent except in its earlier season.

PELARGONIUM NEW LIFE, *Floral Magazine*, t. 288.—A Zonal Pelargonium, with singularly striped red and white flowers. It is stated to have originated as a sport from Vesuvius, a variety notorious for eruptions of this character. Mr. H. Cannell.

PENTSTEMON CENTRANTHIFOLIUS, Benth., *Flora des Serres*, t. 2309.—A fine species, with sessile lanceolate leaves, and many-flowered racemes of tubular scarlet flowers. Native of Upper California, whence it was introduced to Chiswick by Douglas.

PITCAIRNIA MUSCOSA, *Revue Horticole*, 1877, p. 430.—A species with tufted linear leaves and long-stalked racemes, well set up above the leaves, and bearing a large number of handsome linear orange-red or vermilion-coloured flowers, each nearly 2 inches long. Native of Brazil.

PRIMULA SINENSIS EVA FISH, *Florist*, December, 1877.—A double-flowered variety, with flowers of good form, and of a bright rosy lilac tint. A very pretty variety, sent out by Messrs. E. G. Henderson.

RHODANTHE MANGLESII, Lindl., VAR. **MACULATA**, *Flora des Serres*, t. 2291.—A charming "everlasting," well known in this country; at first grown under glass, but shortly found to be hardy, and, what is more remarkable, the plant is recorded by Schübler to have flowered and produced seed in the Lofoden Isles! off the northern coast of Norway! thanks to the continuous sun and light during the short summer of those all but Arctic regions. The plant is a native of Swan River.

ROSE GUSTAVE REVILLIOD, *Journal des Roses*, December, 1877. Seedling raised by Joseph Schwartz from Victor Verdier. The habit seems like that of Baroness Rothschild, the flowers large, full, globular, rose pink.

SALVIA LEUCANTHA, Cav., *Flora des Serres*, t. 2293.—A species with lanceolate leaves, covered with

white down on the under surface. Flowers white, in terminal verticils arranged in a terminal cluster. Native of Mexico.

SEDUM UMBILICOIDES, Regel, *Gartenflora*, t. 917.—A species with tufted oblong linear pointed fleshy leaves, and long flower stalks with scattered sessile leaves and loose panicles of small white flowers spotted with red. Collected in Alatan by Mr. A. Regel.

STATICE BOURGÆI, Webb, *Flora des Serres*, t. 2292.—A species with broad lyrate leaves, winged stems, corymbose inflorescence, lilac calyces, and white corollas. Native of the Canaries. Figured also in *Botanical Magazine*, 5153.

STENOSPERMATUM WALLISII, Mast, *Botanical Magazine*, t. 6334.—A very remarkable and beautiful Aroid with nodding boat-shaped ivory white thick spathe. Figured in *Gardeners' Chronicle*, 1875, i. p. 558. Central America? Wallis, Messrs. Veitch.

TODEA INTERMEDIA, *Illustration Horticole*, t. 290.—A very beautiful Fern, with pinnately much divided translucent fronds, arranged in tufts. A native of New Zealand. M. Linden.

TREE CARNATIONS, *Floral Magazine*, t. 286.—The varieties figured are Sir Garnet Wolsley, buff ground striped with red; Osman Pacha, brilliant red, fine substance; and Tricolor, ground colour pale yellow striped with magenta. All seedlings raised by Mr. Turner, of Slough.

TRILLIUM SESSILE, L., *Flora des Serres*, t. 2311.—Figured so long ago as the 2nd volume of the *Botanical Magazine*, t. 40. This curious North American species demands the attention of the plant lover in its spotted leaves and purple flowers.

ZAMIA OBLIQUA, Regel, *Illustration Horticole*, t. 289.—A tree with a crown of foliage, the individual fronds being pinnately divided with broad ovate lanceolate segments. Corrientes, New Granada. M. Linden.

NEW PLANTS CERTIFICATED

whereby every section shall be exhibited by itself. What amusement would be caused in the horticultural world if some exhibitor showed two bunches of Black Alicante Grapes in the class for Hamburgs, or *vice versa*; and yet we read of Elaine being set up in company with some of the large incurved section. The Japanese section deserves a prominent place, and should be exhibited by itself. The same may be said of the large incurved, the medium incurved, and reflexed sections; whilst the quilled type, of which Faust is an example, ought to be omitted from the lot.

Chrysanthemum culture is only in its infancy, and the sections require re-adjustment; but too much need not be expected till some enterprising society takes the matter in hand. Can the Royal Horticultural Society do nothing? *W. Hinds*.

THE GENUS AGAVE.

(Continued from p. 748.)

SERIES III.—FLEXILES.—Texture of the leaf thinner, less fleshy, and more flexible than in the *Coriaco-carnosa* and *Carnoso-coriacea*, but still rather rigid. End-spine usually slightly pungent, and teeth distinct.

Group XI. VIVIPARÆ.—Leaves distinctly toothed. End-spine sub-pungent.

** Leaves linear-ensiform.

94. *A. pugioniformis*, Zuccarini, in *Nova Acta*, vol. xvi., part 2, p. 676; Kunth, *Enum.*, vol. v., p. 836; Jacobi, *Monogr.*, p. 142.—Acaulescent. Leaves linear-ensiform, 1½–2 feet long, 6–8 lines broad, rigid, glaucous, narrowed gradually to a firm brown-purple or blackish end-spine 6–8 lines long, slightly concave on the face, the teeth small, distant, deltoid-cuspidate, dark brown, straight or uncinat. Inflorescence unknown.

Mexico, introduced about 1830. It seems a very distinct plant, but I have not met with it in any of the English collections.

95. *A. serrulata*, Karwinski; Jacobi, *Monogr.*, p. 142.—Acaulescent. Leaves linear-ensiform, 2–2½ feet long, 1 inch broad at the middle, narrowed to ¾ inch above the base, glaucous, the old ones hanging down, the end-spine very small, black, the face shallowly channelled, the small teeth crowded in the lower part of the edge, at first greenish, finally brown. Inflorescence unknown.

A native of Mexico, introduced in 1842. Not seen in the English collections.

** Leaves lanceolate or ensiform.

96. *A. rubescens*, Salm-Dyck; Kunth, *Enum.*, vol. v., p. 835; Jacobi, *Monogr.*, 143.—Acaulescent. Leaves narrow lanceolate, reaching a length of 2 feet, 1½ inch broad, glaucous, or in bright sunshine or when fading purplish, subfalcidly recurved, the upper part deeply channelled, the margins undulated, the end-spine slender and brownish, the minute crowded teeth whitish with a yellow-brown tip. Inflorescence unknown.

Mexico, described by Salm-Dyck in 1834. Not seen in the English collections.

97. *A. (Euagave) vivipara*, Linn., *Sp. Plant.* edit. 2, p. 461 (at any rate as regards the synonym, Rumph., *Amboin.*, vol. v., p. 273, tab. 94); Wight, *Icon.*, tab. 2024, non Salm-Dyck; *A. Cantula*, Roxb. *Fl. Ind.*, vol. ii., p. 167; *A. Rumphii*, Hassk., *Cat. Hort. Bogor.*, p. 37; Jacobi, *Monogr.*, 143; *Fourcroya Cantula*, Haworth, *Syn. Succ.*, p. 42; Kunth, *Enum.*, vol. v., p. 843; *Agave Cantula*, Galeotti; Jacobi, *Nacht-rage*, i., p. 45; fig. 150.—Shortly caulescent. Leaves 20–50 in a dense rosette, ensiform, reaching a length of 2–3 feet, 1½–2 inches broad at the middle, narrowed to 1–1¼ inch above the base, dull green when mature, narrowed gradually from the middle to the point, glaucous in an early stage, thin but firm in texture, flat or channelled down the face, the base ½ inch, the centre 1 line thick, the brown firm end-spine ½ inch long, the deltoid substiant brown hooked teeth ½–1 line long. Inflorescence reaching a height of 20 feet or more, the deltoid panicle about a quarter the length of the scape, the flowers in dense corymbs on stout peduncles. Ultimate pedicels very short, subtended by minute deltoid bracts. Perianth 1½–2 inches long; ovary narrow-oblong, ¾–¾ inch; tube broadly funnel-shaped, ¾–¾ inch; segments greenish, yellow on the face, linear-oblong, ¾–1 inch long. Filaments inserted at the throat of the short tube, finally half as long again as the segments; anthers ¾–¾ inch. Style reaching to the top of the filaments. Flowers often changed into bulbiliferæ, which bear lanceolate leaves ½ foot long before they fall and take root.

This is the Agave widely spread through various parts of the Old World, for which I follow Dr. Wight in keeping up the Linnæan name of *vivipara*, as it is evidently what is intended by Rumphius, whose figure Linnæus cites. Jacobi and Salm-Dyck describe another plant, relying upon a reference by Linnæus to a plate of Commelinus, which I have not seen. The above description of the rosette is taken entirely from specimens at Kew and Reigate, and of the inflorescence from Wight's account and copious specimens in the Kew herbarium, but it quite coincides with the detailed description by Jacobi of *A. Cantula*, Galeotti, at p. 45–47 of his first *Nacht-rage*. The habit of the plant is quite that of *lurida*, but the texture is different, the colour less glaucous, and the end-spine and the prickles are smaller. It has been flowered lately by Mr. Thos. Hanbury at Mortola. Besides copious specimens from different parts of India we have it from Fernando Po, gathered by Mann, and it is not unlikely *A. angustifolia*, Haworth *Syn.*, 72, from St. Helena, may belong here. This, I think, is the plant intended for *A. vivipara* by Miller in his *Garden Dictionary*, so far as can be gathered from a short description. Judging from the descriptions alone I should expect *A. bulbifera*, Salm-Dyck, Jacobi, *Monogr.*, p. 163, said to be

1834. My notes are taken from a small specimen in the Kew collection. It is allied to *A. sobolifera*.

** Leaves oblanceolate-oblong.

100. *A. (Euagave) sobolifera*, Salm-Dyck, *Hort.*, 1834, p. 307; Kunth, *Enum.*, vol. v., p. 822; Jacobi, *Monogr.*, p. 121; *A. antillarum*, "Desc.;" Engelm., *Notes*, p. 25.—Shortly caulescent. Leaves 20–40 in a rosette, oblanceolate-oblong-spathulate, 2–3 feet long, 3–5 inches broad at the middle, narrowed to 2–3 inches above the base, very bright green, the base 1 inch, the centre ½ inch thick, the face deeply channelled, the border much raised and tip often recurved, the sub-pungent chestnut-brown end-spine about ½ inch long, the distant brown deltoid uncinat teeth ½–½ inch long. Scape 8–10 feet high, 2½ inches thick at the base. Flowers in a deltoid panicle, of which the lower branches are 9–12 inches long, and bear a hundred flowers each; pedicels 3–12 lines long. Perianth, including the 15–18 lines ovary, 2–2½ inches long; tube greenish yellow, 2–4 lines; segments linear-oblong, bright yellow, ¾–1 inch long. Stamens inserted at the throat of the perianth tube, the filaments less than twice as long as the segments. Capsule ovoid-prismatic, cuspidate, 1½–1¾ inch long, 7–8 lines in diameter; seeds ¼ inch broad.

A native of the West Indies. I see no reason to doubt that, as stated by Salm-Dyck, this is the plant

FIG. 150.—AGAVE VIVIPARA.

a Mexican plant introduced by Karwinski, and *A. stenophylla*, Jacobi, *Monogr.*, p. 257, to belong here. *A. flaccida*, Haworth, which I know only from a very short diagnosis, may perhaps fall in this vicinity.

98. *A. laxa*, Zuccarini; Kunth, *Enum.*, vol. v., p. 838; Jacobi, *Monogr.*, p. 146, fig. 151.—Shortly caulescent. Leaves 50–60 in a rosette, ensiform, reaching a length of 2–2½ feet, 18–20 lines broad at the middle, 1 inch broad above the base, narrowed very gradually from the middle to the tip, bright green, slightly glaucous towards the base in an early stage, the base ½ inch, the centre ½ inch thick, the firm dark chestnut-brown tip about ¼ inch long, the distant minute lanceolate-deltoid brown curved spines about 1 line long. Inflorescence unknown.

History unknown; first noticed in Salm-Dyck's *Hortus Dyckianus* in 1834. I strongly suspect it to be a variety of *A. vivipara*. My notes were taken from the specimen which was photographed in the Saunders collection and is now here engraved.

99. *A. bromeliifolia*, Salm-Dyck; Kunth, *Enum.*, vol. v., p. 834; Jacobi, *Monogr.*, p. 164; *A. toxomuliana*, Karwinski.—Acaulescent. Leaves lanceolate, spatulate, reaching a length of 2–2½ feet, 2–2½ inches broad at the middle, narrowed to 1 inch above the base; bright green, the end-spine weak, the distant lanceolate-deltoid hooked red-brown teeth 1–1½ line long. Inflorescence unknown.

A native of Mexico, introduced by Karwinski in

figured and described by Hermann in the year 1678, in his Catalogue of the Plants of the Botanic Garden at Leyden, under the name of "*Aloe americana sobolifera*." His plate (tab. 17) is one of the best of the old figures. He writes of it (page 16) "*Ex crassa fibrosa pallescente radice prodeunt folia, facie vulgaris Aloes Americane junioris, carnosa, succulenta, modo plana et humi procumbentia, modo canaliculata et arcuatum sursum vergentia, late viridia, in mucronem minus pungentem abeuntia et in ambitu crebrioribus exiguis fuscis rigidulis spinulis armata.*" All this applies to our present plant exceedingly well. The synonym is mentioned by Linnæus as approaching to but not belonging to his *vivipara*, and by Lamarck is cited under that species. My notes upon it are taken in the Reigate and Kew collections, and of the inflorescence and flower from Dr. Engelmann, whose specimens were gathered in 1871 by Wright and Parry in San Domingo. In colour and habit the plant recalls *Fourcroya cubensis*, differing in its upright leaves, deeply channelled and often curved over at the tip, and small prickles and terminal well. I cannot follow Dr. Engelmann in calling it *A. antillarum*, Desc., as the figure cited is an extremely bad one, and Descourtilz does not give the name as one of his own, or characterise any species of Agave in particular. I am not aware that it has ever flowered in cultivation in Europe of late years. It is the only plant I have seen under the name vivi-

para in English gardens. It is excellently represented in the series of photographs made for Mr. Saunders. *A. vivipara*, Salm-Dyck; Kunth, Enum., vol. v., p. 822; Jacobi, Monogr., 121, seems, from the description, to resemble *A. lurida*.

Group XII. YUCCIFOLIÆ.—Leaves sub-entire or obscurely serrulate. End-spine not at all pungent.

101. *A. (Littæa) yuccifolia*, D C., in Red. Lil., tab. 328—329; Kunth, Enum., vol. v., p. 830; Hook., in Bot. Mag., t. 5213; Jacobi, Monogr., p. 146; *A. Cohniana*, Jacobi, Monogr. 264.—Shortly caulescent. Leaves 20—40 in a dense rosette, linear, much recurved, $1\frac{1}{2}$ —2 $\frac{1}{2}$ feet long, $\frac{3}{8}$ —1 inch broad at the middle, dilated to $1\frac{1}{2}$ inch at the base, deeply channelled all down the face,

102. *A. (Littæa) spicata*, Cavan, Descr., 454; Kunth, Enum., vol. v., p. 828; Jacobi, Monogr., p. 187 (excluding the synonym, *A. polyanthoides*, Cham. et Schlecht), but not of De Candolle.—Leaves spreading, lanceolate, acute, 2 $\frac{1}{2}$ feet long, nearly 3 inches broad at the base, where it is 4 lines thick, channelled, the margins serrulate. Scape 15 feet long, $1\frac{1}{2}$ inch thick at the base, pale green, terete, the bract-leaves lanceolate-subulate. Spike 6 feet long; pedicels about 1 inch long, 2—3-flowered, adpressed to the rachis; bracteoles ovate, acute, $\frac{1}{2}$ inch long. Perianth greenish; ovary oblong, 1 inch long; tube short; segments linear-oblong. Filaments twice as long as the segments.

Described by Cavanilles in 1802 from the Madrid botanic garden, and supposed to have been brought

custom of decorating with evergreens at Christmas is, remarks a writer on the subject, far from being a modern one. The Romans 2,000 years ago did the same thing; indeed it is more than probable that the origin of adorning our houses with Ivy, Holly, and Bay, must be sought for in the Roman Saturnalia, held every year towards the end of December. "It is a symbol of our faith in the renewing power of the sun, that, as the seasons return, the earth will be once more clothed with green, the trees laden with fruit. According to an old poetical belief, the sylvan spirits flock to the evergreens in our houses, and remain unnnipped by frost."

Holly and Mistletoe are mostly used for Christmas

FIG. 151.—AGAVE LAXA.

he base not more than $\frac{1}{4}$ inch thick, the centre $\frac{1}{2}$ inch, dull, rather glaucous green, with a pale band down the centre, the tip not at all pungent, the back broadly rounded, the edge narrowly brown-scarioso, entire or obscurely serrulate. Scape 12—20 feet high. Flowers in a dense spike 6—15 inches long, about 4 inches in diameter, sessile, solitary or in pairs. Perianth $1\frac{1}{4}$ — $1\frac{1}{2}$ inch long, including the $\frac{1}{2}$ inch ovary; tube funnel-shaped, $\frac{1}{4}$ — $\frac{1}{2}$ inch; segments greenish yellow, linear-oblong, spreading, $\frac{1}{2}$ — $\frac{3}{4}$ inch. Filaments inserted at the throat of the tube, twice as long as the segments. Anthers $\frac{1}{2}$ — $\frac{3}{4}$ inch. Style reaching to the top of the filaments.

A native of Mexico, introduced about the beginning of the century, and long ago widely spread in collections. There is a full account and coloured figure in the *Botanical Magazine* from a plant that flowered at Kew in 1860. It is a most distinct and unmistakable species.

there from Havana. No one else seems to know anything about it. Judging from the description its alliance appears to be with *A. yuccifolia*, whilst *A. polyanthoides*, C. and S., referred here by Kunth, is evidently a synonym of *A. spicata*, D C., which belongs to the section Manfreda, and is a synonym of *A. brachystachys*, Cav. *f. G. Baker.*

The Villa Garden.

CHRISTMAS DECORATIONS.—The return of the Christmas season brings with it its quota of pleasurable labour, in the way of house decoration; for Christmas, without some such touches of festive home-embellishment of this character, would be as if deprived of one of its leading characteristics. The

decorations; but there are other evergreens equally effective for the purpose, though lacking the power of association belonging to the two just named. Of these may be mentioned the Ivy, Bay, Laurustinus, Portugal Laurel, Aucuba, Eonymus, the Fir tribe, and others too numerous to mention. The Holly is indispensable because of its clustering bright coral-red berries, which are fortunately more numerous than usual this year. Indeed, what could we put in the place of the coloured berries of the Holly? We should be thrown back on the berried Aucubas, but they are scarce and difficult to procure at this season of the year. Then there are the berried Solanums, just now in the height of their beauty as berry-bearing plants; the curious Iris fetidissima, which is plentiful in many old gardens, and valuable, because when the seed pods expand in autumn, after drying off, they

present to view numbers of coral berries which have a charming effect when appropriately associated with evergreens; and, lastly, what can sometimes be obtained in plenty in country districts—bunches of the bright coloured berries of the Dog Rose. We have seen these employed in Christmas decorations with great taste and effect. Some bright patches and touches of colour are much needed to give life to the sombre hues of the evergreen; and here berries can be made to play a most important part, supplemented by sprays of gold and silver Hollies, variegated Aucubas, and, if they can only be obtained from a neighbouring conservatory, the light and airy tresses of the variegated *Cobrea scandens*. When obtained from a cool house it will last a considerable time, fresh and pleasant to behold.

And for supplying acceptable glimpses of colour—and whatsoever is bright and cheerful seems to be in keeping with our Christmas festivities—we can highly commend the use of dyed Everlastings, such as *Gnaphalium*, *Acroclinium*, *Rhodanthe*, *Xeranthemum*, *Helichrysum*, and also many grasses that are now charmingly coloured for this special work. A little taste will suggest how these may be made to render most effective service at many points of advantage. The *Gnaphalium* are now dyed in many very effective hues, and if a few flowers of each colour, or of mixed colours, be bunched together, they give a tone and warmth to the sprays of green against which they are placed.

In some cases it may be difficult to obtain wreaths and tresses of Ivy, and indeed much evergreen, and that not that it is scarce, but because living away from centres where it is grown, it becomes an expensive article. Next to Nature's own living green comes the artificial tresses of evergreen now so much manufactured, and, it must be admitted, with considerable fidelity to Nature; and some elegant and effective metallic wreaths are also now constructed, that are very valuable for twining round chandeliers and gas jets, and in any places exposed to heat. In such positions evergreens soon decay, and the leaves shrivel up; they are also apt to drop on the table on inconvenient occasions; while there is to be considered also the danger of their taking fire. We once saw some blazing leaves suddenly fall in the midst of the supper table, and a most uncomfortable panic ensued! There is yet another article of manufacture that can be specially commended for Christmas decorations, namely wreaths of paper cut in the shape of the living green and decaying brownish yellow leaves of Fern. They are cut in long strips, the green and brown fronds alternating and hanging to a narrow riband of paper. They are most useful for covering pier glasses, large frames of pictures, &c., but as they are of a very inflammable character, they should not be brought near to lighted candles and gas jets.

In order to make effective and pretty designs from whatever materials, good taste, practice, skill, and a general knowledge of the various subjects is indispensable. According to the style of decoration determined on the foundation must be selected. For garlands, flexible galvanised wire or strong cord should be used; the latter is preferable, as it is not so liable to twist as wire; and for what are termed upright wreaths, mouldings, and panels, fine iron rods are best. For anything in the way of ornamental devices, perforated zinc or a piece of wire netting is of great service; a strip of such netting is sometimes used with great effect tied to the balusters of a staircase (when it surrounds in some part an entrance hall), and sprays of evergreen thrust into it, with here and there discs, diamonds, shields, crosses, &c., in coloured everlastings.

Having indicated the subjects that can be employed at the Christmas decorations, their arrangement must be left to the circumstances under which they are to be used, and to the taste and skill of the decorators. The female members of the household have here good scope for displaying any taste they may possess, and so array the days which form the Christmas season with such a garb of welcome and gladness as that shall mock the surrounding gloom, and shut out from the home circle gathered round the family hearth, any borrowed tinge of sadness from the dreariness without.

Notices of Books.

State Forestry; its Climatic and Financial Aspect. By Captain Campbell-Walker.

Some time since we had occasion to notice a very clear *résumé*, by Captain Campbell-Walker, of the needs for a system of forest conservancy in India and the colonies, and the general principles to be followed in carrying it out. The paper in question was read before the New Zealand Institute, and has been followed by a second on the climatic and financial aspects of State forestry. In the present lecture Captain Walker briefly passes in review the aspect of the case as regards the influence of forests on rainfall and other

climatic conditions, being careful not to run into exaggerations and misconceptions on the subject, as some of his predecessors have done. This portion of the subject, however, contains less novelty for the English reader than that relating to the financial part of the question. The question of direct financial gain should ever be subordinate, in the case of State forests, to their conservancy for climatic considerations and improvements to meet the demands of the future. "So long as this is borne in mind, and we are not tempted to overdraw and trench on the capital as well as the income of our forests in the shape of timber and minor produce there is no reason why they should not be dealt with like any other property, nor why the State, as proprietor in trust for the public, should not derive from them the maximum amount of revenue compatible with the general welfare of the people." Captain Walker recommends in the case of New Zealand that a small portion of the existing forests of the colony should be properly conserved and maintained, the cost of so doing being defrayed from the sale of surplus land, &c. The Government should claim and receive a fair share of the value of timber on the waste lands of the colony, and not allow it to be monopolised by individuals, or, worse still, he wasted and destroyed. Much of Captain Walker's address is applicable solely to New Zealand, but the following extracts are of more general interest:—

"Forest conservancy in India by a State or Government department dates from about twenty years ago. The department, from very small beginnings, originating in many provinces in the mere appointment of a few forest guards to protect certain trees, and the establishment of a few small nurseries and plantations, has gradually taken charge of a very large public estate, consisting of forests all more or less deteriorated to an extent of which you in New Zealand can have no idea, devastated yearly by fire, overrun by countless numbers of cattle and sheep, whose herds considered they had a right to cut down any tree from mere wantonness, or to allow their beasts to feed on the leaves, and encumbered with the rights and privileges of a native population of over 200,000,000. Not a promising property to tackle and improve, still less to exact an annual surplus from. Still it has been done, and by the last returns for the whole of India, which I have with me, viz., those for 1873-74, the forest revenue was £700,000, and expenditure £414,000 odd, leaving a surplus of upwards of £285,000, or 41 per cent. on the total revenue. Both revenue and expenditure are about double what they were ten years previously, in 1864-65."

Speaking of the Eucalyptus plantations in India, Captain Walker says:—

"The yield of the Eucalyptus plantations on the Nilgheri Hills is far exceeding the most sanguine expectations. The conservator and a trained forest assistant, having made a careful estimate and a series of actual experiments, the former officially reports the yield at 1450 cubic feet, or 25 tons (58 cubic feet to the ton) of dry weight per acre per annum, whilst the indigenous forests on the Nilgheris, which have not been conserved, yield only half a ton per acre per annum. This speaks volumes for the financial benefit likely to be derived from planting the Eucalypti in some parts of this country, where the climate closely resembles that of the Nilgheris. I may mention that the average out-turn of indigenous New Zealand forests, as stated by saw-millers, does not exceed 15,000 superficial feet—1250 cubic feet—per acre, and then it is presumed to be exhausted for ever. Mr. Kirk and I estimated the proper out-turn in timber, in a portion of the Seaward Bush, Invercargill, at close on 31,000 superficial feet—say 2500 cubic feet; but it must be remembered that under the present system much timber which would be utilised elsewhere is discarded as worthless, and all small stuff is considered utterly valueless. I am in correspondence with the chief engineer on the subject of making use of it for the railway locomotives wherever practicable; and if we can thus find a market for it even at very little over price of actual haulage and sawing into billets, I consider that a great boon will be conferred on the saw-mill industry and the colony."

"Leaving India, and turning to the continent of Europe, I find that the annual revenue of the Forest Department in Prussia is £2,100,000, disbursements rather more than half, leaving a net profit of £1,000,000, the disbursements including an item of £75,000 for commutation of forest rights and servitudes. The net profit in Saxony is £249,000; Bavaria, £595,000; Austria, £90,000; Hanover, £162,000; whilst that of some of the smaller States, for which I have not returns in money, must be much greater in proportion, if we take their yield in timber as a guide. I may mention that, in Bavaria, the proportion of forest to total area is 34.4 per cent., or upwards of 1 acre per head of population. This is the largest area, in proportion to total extent or head of population, of any State in the German Empire."

Natural History.

WOOD PIGEONS.—We have in this locality a fine crop of Beech mast, and have in consequence been visited by incredible flocks of wood-pigeons; their numbers are really in thousands. In the morning they may be seen flying off to their feeding grounds, and at night return to a large Pine wood to roost, when the flapping of their wings makes an extraordinary noise. Can any of your readers tell us where they all come from? Have they come from some northern country and travelled south, where the climate is better and the food more plentiful? Their colour is blue. *J. Rust, Eridge Castle.*

Garden Operations.

PLANT HOUSES.

CEPHALOTUS FOLLICULARIS.—This most singular little plant would no doubt be much more generally cultivated than it is were it not for the fact of its disposition to dwindle away slowly. This is often attributable to its being grown in too much warmth, a condition under which it will exist sometimes for years, if kept near the glass, which to a certain extent helps it to bear up against the adverse condition of too much heat. So treated it frequently attains a size such as seldom results from a more natural temperature, but which is really nothing more than a spasmodic effort consequent upon over excitement. If the plant is kept from this time through the winter in a temperature of 45° with a bell-glass over it, a little tilted so as to preserve a more equally humid atmosphere around it than would exist if fully exposed to the house, this will suit it; but such a temperature, although conducive to continuous health, would not answer for plants that have been kept through the summer and autumn in a stove, and have consequently made their growth under conditions not calculated to impart a sturdy vigorous state. *Dionæa muscipula*, an equally interesting and suitable companion to the above, is best wintered in a similar temperature, unless previously kept in too hot quarters, in which case I should advise both these plants being gradually inured to cooler treatment all the year round. Where greenhouse plants have been temporarily stood in vineries, if their foliage is of a nature susceptible to injury from mould, it may be well to caution beginners in their cultivation to keep a good look-out, that they do not suffer from the effects of the leaf-talks of the Vines falling off and lodging in them. I have seen fine plants of such things as *Phœnocomma prolifera* so far destroyed as to be of little further use, right through where they had attained the thickness of a person's finger, by contact with these stalks, which naturally were in a damp, mouldy condition. Large specimens of *Dasyliroon*, *Beaucarnea*, and *Cordylina indivisa*, will suffer by the stalks lodging in their centres—if only allowed to remain for a few days in contact with the young leaves—so as to destroy the symmetry of the plants for a year or two afterwards, and if overlooked for a considerable time will lose their crowns altogether. The *Cordylina* is a difficult subject to bring safely through the winter, as most who have essayed its culture are aware; under the best conditions a certain portion of the roots die annually; they are as impatient of too much moisture in the soil at this season as those of a Pine-apple, and to winter the plant successfully, the best means is to keep it in a similar dry condition to Pines through this its season of rest. *T. Baines.*

FRUIT HOUSES.

VINES.—In all-the-year-round Grape establishments a well-appointed Grape-room is now considered as important as the house in which the late fruit is grown. To ensure the preservation of the Grapes over a period of five months the room must be dry, well ventilated, and secure from the ingress of frost. The Grape-room at this place is built with hollow walls, over the men's mess-room, in one corner of which I have a small slow combustion boiler, with a flow and return pipe passing through the floor and along one side of the room. This arrangement enables me to maintain a steady temperature of 50°, does away with all dust or disturbance, and the Grapes keep fresh and plump till June. Racks for holding the bottles are fixed to the walls, and now the wood is ripe we are preparing to move our Muscats and Lady Downes to their winter quarters. The Vines will then be pruned, dressed, and made ready for a fresh start. Where Gros Colman, Gros Guillaume, and Alicante are grown, the long-rod system of pruning should be followed, but Lady Downes succeeds well if closely spurred to a good eye. After pruning, all the wounds will require dressing with Thompson's Styptic to prevent bleeding. All glass, wood-work, and pipes must be carefully washed, and,

to insure the removal of the larvae of insects, loose soil and mulching may be cleared off the inside borders preparatory to top-dressing with fresh turf and bone dust. Where the inside border of the earliest house was well soaked with water at a temperature of 90° at the time it was closed, and the economical system of obtaining heat from fermenting material placed within the structure has been followed, forcing through the past mild weather will have been carried on with a minimum of fire-heat. If a portion of this material is turned over two or three times a week to set at liberty steam and moisture, a strong and even break may be depended upon, and the young shoots will luxuriate in this genial system of heating. Another powerful aid to the production of dense bunches of early Grapes is the judicious use of mild fermenting materials placed on the outside borders. The mistake which often leads to failure and condemnation of the practice may be traced to its too early application before the Vines break, and its entire removal before the wood is ripe. By an experiment tried here last spring with fermenting Oak leaves alone, covered with shutters, the temperature of an outside border was raised from 46° to 60° in six weeks, and when the last layer was taken off, and the border raked and swept in October, thousands of bright healthy roots were found running along the surface; these were shortened back, and received their annual dressing of fresh turf and bones, followed by a good mulching of short stable-dung. This will remain undisturbed until the Vines begin to break. *W. Coleman.*

PEACHES AND NECTARINES.—In the Calendrical remarks under this heading for the week ending November 10, reference was made as to the time for starting these trees for giving an early crop of fruit, and directions were also recorded concerning the mode of treatment to be applied during the earliest stage of forcing operations. At that time we put into practice what we preached, and now Nature in the trees "here" is quickened so far that the flowering process has already commenced. This degree of forwardness may, however, not yet be attained with trees which have not "annually" been accustomed to forcing operations. Therefore it will not be wise to endeavour to push them forward too harshly, but to let the same conditions continue in force "as were before recommended," until such time as Nature is animated, and the flowers begin to expand. At this stage we prefer 50° as a mean "under ordinary conditions" at night, and allow a few degrees fall under extreme pressure from the effect of cold wind or severe frost, and to have it stand at 55° by the time it is daylight, and 60° throughout the day, until daylight disappears again. We continue to moisten the surfaces about the house as heretofore and syringe the trees lightly once or twice daily according to circumstances, that is to say if they become dry. At this advanced season the setting period is undoubtedly the most important of all throughout the whole process, and therefore it should have the utmost diligence and care given to the requirements during this period. Circulation of the air in the house is an essential and important element in connection with gaining a free set of fruit; open the ventilators a little way constantly at 57°, and at 70° give it freely both at the top and front of the house; of course this degree is not intended to be attained by means of fire heat alone; 60° should be the maximum from this source, and 57° for finally closing up for the day. Lose no favourable opportunity "when the house is well ventilated," to go over the flowers with a camel-hair pencil. I should not like to forego this operation at this season. In March, when Nature has the assistance of the bees and other naturally favourable conditions, it is a common thing to hear of wonderful sets of these fruits, but they do not often appear in the month of January, and therefore let not the artificial means at command be neglected. *George Thomas Miles, Wycombe Abbey.*

HARDY FRUIT GARDEN.

Much has been said from time to time as to the desirability or otherwise of protecting Figs during the winter, some averring that it is a useless proceeding and others as stoutly advocating the practice. As to whether protection is necessary or not, a great deal depends on the soil and situations in which they are grown, for if cold and wet, and far inland, the wood they form is of such a soft, pithy nature as to be totally unable to endure sharp frosts. With a chalk subsoil and near the sea coast or in other favoured localities, the growth they make is altogether different, being shorter jointed and more woody and therefore of a better texture throughout. That some shelter is requisite the past season has afforded proof, as owing to the mildness of the previous winter Figs bore with more freedom than they have done for many years, thus showing that the injury is generally done when the fruit is in an embryo state, as it cannot be said that the spring was at all in their favour. In the majority of cases when Figs are covered, the thing is generally overdone by putting them under

thick layers of straw, which by keeping them close and warm brings them on too fast, and thus being in a half-bleached tender state when first exposed they are sure to be destroyed. The best way of protecting them is to tie them as closely together as can conveniently be done, and then place a layer of Spruce Fir branches over them in an inverted position, which if close to the wall and made secure against wind will answer every purpose without being an eyesore or presenting an untidy appearance. To be uniformly successful with Figs, however, it is necessary to restrict them at the root, for however skilful the top management may be, they are such gross feeders and ramble so far beneath the soil as to grow rampant and out of all control, even though they may be well attended to by way of pruning and stopping. If before planting the bottom is concreted at about 2 feet 6 inches deep, and a barrier of the same formed round a hole 3 or 4 feet across, there will be no difficulty in getting hard, short, stubby wood, with a fruit at every joint.

On looking over the Strawberry plantations I find that, although the crowns are plump and well developed, the plants are not in that mature condition which will fit them to withstand sharp frosts and cold cutting winds. This condition arises from the late growth they made and the heavy rainfall that has since taken place, which has kept the roots in a state of activity and the foliage almost as green as at any time during the year. To remove any of this now, as is sometimes done, is a most unwise proceeding, as it is their natural protection and affords more shelter from cold blasts than most people imagine. Strawberries being shallow-rooted plants and forming fresh feeders around their crowns with the advent of their spring growth, a heavy mulching of half-rotten manure is of great assistance, and answers the double purpose of enriching the ground and rendering them safe during the vicissitudes of winter. As the weather may soon set in severe, no time should be lost in getting it on, and if dung is scarce it may be eked out by the addition of loam or fresh soil, as anything of that kind acts beneficially if applied with an unsparring hand. Seeing the great value of the alpine kind for carrying on a supply when the more choice sorts are over, it is deserving of much more attention than is at present accorded to it, for if well treated there is no end to its bearing, and if not showy the fruit are exceedingly palatable and refreshing, and of great use for ices and sweetmeats. A cool half-sunny border is the best place to grow these on, and if seed is sown in pans in heat any time during March and the plants pricked out when strong enough they will come into bearing during the autumn, and be found a most useful addition to the dessert at that season.

The double-bearing Raspberry is most valuable, but in the planting of this a well-sheltered open spot should be chosen, and the soil made rich and deep by double digging or trenching, and heavy manuring. Many fail in fruiting this in October through allowing it to bear in the summer, to prevent which all the canes should now be cut away level with the ground, and in spring the young shrubs thinned out to eight or ten of the strongest. Among the summer fruiting varieties there are none equal to Fastolf, either for size, free-bearing habits, or other good qualities. The present is a good time for forming plantations of these, the canes in which should be placed a yard apart, quincunx fashion, so as to admit plenty of light and air amongst them, and afford room for free access in gathering the crop. The best way after planting is to cut the canes down, or to do so in the spring just before they start, after which what fresh ones they make during the summer will be sturdy and strong. A mulching around them is very desirable to repel frost, and the spare space between will come in admirably for Cauliflower or any other vegetable that is cleared off early. *J. Sheppard.*

KITCHEN GARDEN.

We are now approaching the end of another year, and, on taking a retrospect, I cannot but think that we have abundant cause for thankfulness, that, on the whole, it has been a very plentiful season in this department. It is true that during the spring months we had a considerable portion of unkind weather, which, in many parts of the country, proved very destructive to the fruit crops, but was not sufficiently severe to interfere materially with the kitchen garden supply. It is seldom that we have had so good a year for the different varieties of spring Broccoli, which kept on bearing so well that Cauliflowers were fairly well-established before the crop of Cattell's Eclipse Broccoli was exhausted, thus proving that with a favourable spring for the hardy sorts, and a judicious and liberal cultivation of the various valuable autumn varieties, there need be no difficulty in placing a dish of either Cauliflowers or Broccoli on the table all the year. With regard to the Brassica tribe generally, the supply has been both good in quality and abundant in quantity, with a slight exception during the worst of the spring months, when greens were rather scarce, but with space at command, Buda Kale, old English

Coleworts, and the dwarf varieties of Borecole will always supply a void of that kind. In the salading department the produce has been both abundant and good. There was a slight blank during the ungenial spring months, owing more to the want of proper appliances for its preservation than to the actual effects of severe weather, and I do not ever remember a more abundant or finer produce than that of the present autumn; care should therefore be continued to store up as much as possible, secure from frost, for supply in severe weather, and to help this out another batch of Whitloof and Chicory may be started. The Turnip Radishes sown on heat last month will now be coming on for use, and should be well ventilated or they will damp off. The early stores of Lettuce and Endive must also be frequently examined, and decayed matter removed; during favourable weather no opportunity must be omitted to ventilate freely, but in very severe frost cover them up securely and keep them dark as long as extreme severity continues. Cauliflower plants in frames must be looked over frequently for the removal of decaying foliage, also to dress and stir the surface; the same remarks apply to the plants under hand lights. Fermenting materials for the various forcing purposes required in this department are so necessary, that as much as can be got together should be constantly under a state of preparation for use, and as a larger bulk than usual is generally required for the next two or three months, it will be found very advantageous to mix an equal proportion of fresh tree leaves with the stable manure, by which the bulk will be doubled, and the heat, although not so powerful as in stable manure alone, will be more constant and lasting, and better adapted for forcing purposes. At this season there is generally a considerable space of ground left vacant after the lifting of root crops; with the trenching up of these the plots occupied by the various sorts of Autumn Broccoli will require to be attended to as early as possible. Hitherto the continued downfall of rain has been against the possibility of wheeling out the necessary dressings of manure and decayed vegetable composts, so that the first favourable opportunity which occurs of a frost sufficient to harden the surface must not be lost, as the sooner such ground is trenched up roughly, and exposed to the air, the better it will be for the future crops. This is more absolutely necessary in the case of heavy soils, which require a considerable amount of knocking about during dry weather, in winter and early spring, to bring them into a sufficient state of pulverisation to receive the crops. Light soils, on the contrary, may be brought into a state fit for cropping with less than half the labour required for heavy ones, but these likewise will be much benefitted by the frequent exposure of fresh surfaces to the influence of the atmosphere. It is important also to observe that success in all the cultural operations in this department may be very much facilitated or obstructed by the efficiency or otherwise of the drainage. In heavy soils especially, if the water cannot percolate away freely, the ground will be water-logged and cold; consequently, early crops in spring are reduced to a minimum, whilst the amount of labour required for cultivation is greatly increased. If, therefore, there is any reason to fear that the drainage is in any way imperfect, the present is the best season to attend to it, and in those cases in which proper drains have been laid down, to see that the outlets are all clear, and the action perfect. *John Cox, Redleaf.*

SOMETHING ABOUT MISTLETO.—The old and pleasant custom of dressing our houses with evergreens has come to us from very early heathen times. Wherever Druidism existed evergreens were wreathed about the houses, that the sylvan spirits might fly to them till a milder season should recall them to the woods. All northern countries seem to have held the Mistleto in the greatest veneration; and in Virgil we read that it was not unknown in the religious ceremonies of the ancients, particularly the Greeks. The cutting of the Mistleto was a ceremony of great solemnity. The people went in procession; the bards walked first, singing hymns, while a herald preceded the Druids. Then came their prince, followed by the people. The Mistleto being found on an Oak, the Prince of the Druids cut it with a golden sickle, giving it to the other Druids, who received it with the greatest marks of respect, and on the first day of the year distributed it among the people as a sacred plant. Mistleto speaks more to us of cheery Christmas as a holy and happy time than of grim Druid days; and we do not trouble to go to the Oak to find the rare bough, as the old Druids did, but content ourselves with cutting it from the old Apple trees it delights in, or the Thorn, Poplar, &c., it not less often chooses to grow on. In the orchards of Worcestershire and Herefordshire many an old tree is green and beautiful in winter, when its own boughs are bare, with the golden-green leaves of the stranger who has quartered himself there, and whose pearly berries are ripe just when they are wanted to add to Christmas festivities. —From "The Story of the Month," in "Little Folks."

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 22, 1877.

THE further proceedings under the SEED ADULTERATION ACT, which took place at the Southwark Police Court before Mr. PART-**RIDGE**, on Saturday last, more than ever proves the necessity for such a repressive measure. It would appear that it is in connection with the Clover trade especially that mal-practices are resorted to, and possibly no seedsmen in the market would be prepared to give a guarantee for the growth of any sample of Clover seed passing through his hands.

The practice of making white Clover into Alsike just now, when the latter is commanding a high price, is one of the worst features of the adulterating process. It is a deliberate attempt to swindle; for it is the substitution of one article for another of a different character, and much lower in price, but which is sold at a greater value. The seeds of white Clover are of a whitish yellow colour, while those of Alsike are of an olive-green, and the two seeds being of much the same form, it is difficult to detect the fraud, especially so if the sample be free of weeds. If mixed with weeds, the character of the weeds, being different to some extent in the white Clover and in the Alsike, is noticed by any one conversant with samples of Clover. But these are few; and the buyer for sowing purposes purchases and puts into his ground something altogether different to what he expects. A preparation of indigo changes the colour of the Clover seeds to the olive-green characteristic of the Alsike.

Another fraudulent practice is that of doctoring Trefoil seeds so as to pass for red Clover. This is done when the latter is scarce, and commands a high price. Just now red Clover is too low in price for necessity to arise for the change, and the expense of colouring could not be advantageously borne. Here, again, those who are conversant with the character of the seeds can detect the substitution by their shape, the seeds of red Clover being kidney-shaped, tapering at one end, and with the kidney-mark in the middle. But the consumer who pays the highest price for the seeds does not even suspect, much less examine, the sample. He buys in the full belief that he is purchasing a *bona-fide* article; and by-and-by, to his sorrow discovers the imposition.

There are two instances of the character of the adulteration practiced, or, shall we not say, the nefarious substitution of one thing for another. But the question arises, are these practices confined to this country alone? Clover seeds are largely imported from France, Germany, Holland, and America. Do our English seed dealers suspect that any adulterating processes are carried out before the seeds are shipped to this country? The Clover trade is a peculiar one in many respects, and it is a rule of the trade to give but short periods of credit, consequently payment has to be made before a great deal of time is allowed for a thorough examination of the samples. Probably a large portion of the trade are not particularly anxious to make this examination. These practices have so grown with the development of the trade that they must have been known to many, and connived at as the easiest method of facing the difficulty. Now that they have been brought to light and made to carry penal responsibilities, there is a desire to discountenance these practices.

But as human nature is essentially human, and one class of the community is regarded as the lawful prey of another, it may be asked—Is it

not likely that the prosecutions now taking place may tend to change the place at which these practices are resorted to, and not materially to prevent them? Is there not a reasonable danger that these tampering processes may be carried across the sea, and performed there?

Judging from the samples that came under our notice some few years ago, the German seed doctors are much more clever than our own. A little care, and specially a little—very little—botanical knowledge will help one to detect dyed seeds; but some of the German Clover seeds were so cleverly imitated, that even a practised eye might have failed to detect the admixture.

It is certain, moreover, that doctoring is done in London to a large degree. But if the scene is simply changed, what guarantee will there be that fraudulent seed will not reach this country and be as rife as ever? It will then rest with the trade to stem the practice, and remembering the clause in the Act, which enacts that every person who "sells or causes to be sold any killed or dyed seeds, shall be punished, &c.," they will not find it difficult to eliminate this plague-spot. Let the more honourable of the dealers—and we would fain believe these are to be found among those having the largest transactions—steadily refuse to connive in any way at these mal-practices; their custom is indispensable to the importers, and the latter cannot afford to lose their trade with them. In this manner something might be done in the way of isolating the evil doers, and so give indirect publicity to their questionable business character.

Of the two cases lately tried, the one failed from the interpretation put by the magistrate on the word "kind;" in the case in question the seed was "improved," which reminds us of JACK FALSTAFF'S "conveyed the wise it call," but apparently, in the magistrate's opinion, the "improvement" did not alter the kind of seed, which remained white Clover still. It is not for us to question magisterial decisions, but if the Act is to be construed according to the intention of its framers, then assuredly any freshening up, either of old seed or of dead seed to imitate new seed, is fraudulent. But here arises a difficulty: old seed is not necessarily bad seed, it may be better than new seed in some seasons, and the dealer who, in a bad year, mixes old seed of good growth with the new seed of the year renders a service to the consumer, and should not be considered an adulterator. Nevertheless, even in this case it is better to be straightforward, and acknowledge the fact publicly. If the thing be done secretly, and suspicion arise, the dealer gets discredit at once in an unmerited manner.

In the last case, reported in another column, evidence was given that the seeds had been made to assume the appearance of seeds of another kind. The trial is of considerable importance, as showing that for colouring or dyeing a conviction can be obtained under the present Act. Seeds which are used for colouring are not clean as a rule, and consequently, even allowing Mr. BENSON to be right in his interpretation of the word "kind," when seeds of Timothy, Thistles, Rib-grass, Trefoil, &c., are made to resemble Alsike, it cannot be denied that they are assuming the appearance of seeds of another kind; and in low qualities of seeds which are coloured, these mixtures are almost always present in large quantities.

A letter appeared in the *Times* on Monday last which set forth in a very open manner that sulphur-smoking and dyeing are very innocent operations, like cleaning or winnowing seed, and are not done so much for the purpose of gain as to benefit the agriculturist. Now seeds, if good, need no doctoring, and are only submitted to this process because the purchaser would not buy them if he saw them in their natural state. This manipulation is, therefore, simply a fraud, intended to deceive the purchaser; and such attempts to throw dust in the eyes of the public may be dismissed without further comment. It was intended by every one who had anything to do with the passing of the Act, to do away with such practices as sulphur-smoking and dyeing; and it was not until

recently that the discovery was made that, taking the interpretation-clause to construe that referring to colouring seed, there was an ambiguity as to the intention of the Act.

There is a large quantity of white Clover, Alsike, and Trefoil, being prepared in readiness for the coming season; and, as is the usual case, the lowest qualities of seeds are those that (to use the adulterators' term) are "improved." If fit for use, they would need none of this "improvement;" and there is no doubt that any one selling these seeds can be prosecuted to conviction under the Act; therefore, we must congratulate those who wish to sell a good article, that they have it in their own power to free themselves from the unfair competition caused by these detestable practices, and it is to be hoped that every assistance will be given by reporting any cases where adulterated seeds are attempted to be sold.

In connection with this we may say that the Royal Agricultural Society will publish the names of any person or persons offering these seeds for sale, running the risk of libel, which risk, however, will be very small indeed.

It is satisfactory to find the public and the trade awakening to the fact that the revelations at our police courts are a reproach and a scandal to honest English trading, and that the sooner they are wiped out the better will it be for the interests of traders and the public generally.

— The veracious author who compiled for the children of all time the fairy story of JACK AND THE BEANSTALK unfortunately omitted to tell his readers in what clime was situated the *locale* of the remarkable growth which he chronicles, or what kind of Bean it was that thus enabled JACK, by its remarkable vegetable development in a single night, to ascend to a new and unknown world. Modern artists, in their efforts to adorn the tale, have invariably accepted the Runner Bean as their ideal, for do we not see illustrations of enormous winding growth ascending heavenward with its top lost in the clouds. Enquiring children will sometimes ask awkward questions, and as they are fairly familiar with the habit of the Runner Bean in gardens, and of its dependence upon some perpendicular support for its elevation, they may be excused for asking up what support did JACK'S famous beanstalk climb. As this is rather a hard nut to crack, and the aforesaid artists have so far given no clue to its solution, perhaps it will be easiest to throw over the Bean theory altogether and adopt one more in consonance with simple fact. What plant is there that combines marvellous rapidity of growth, direct ascension, and strength of wood so fully as does the Bamboo of India, the land of tradition and of fable; certainly not ascending to the clouds in a single night, but producing an upward development that is truly astonishing in its rapidity. If the fabled JACK had the skill in climbing that most modern JACKS possess, he would have found it comparatively easy to have worked his way to the summit of that wonderful Bamboo mast now to be seen in the tropical-house at Syon, which is as big round as a good-sized scaffold-pole, and about 70 feet in height. This superb shoot has developed a growth of over 60 feet in three months, and having reached the top of the glass dome has now been forced to bend its point downwards, as though, like WOLSEY, it had reached the highest point of its career long ere its course was done. This wonderful stem is at least twice the size of any other shoot from the same plant, and deserves to rank amongst one of the marvels of vegetation in our exceedingly ungenial and eccentric clime.

— Messrs. HARRISON, of Leicester, have introduced a NEW PATENT GRADUATING MEASURE, the purpose of which is to facilitate the packing of seeds in various quantities and of various sizes. It is simple in construction, and evidently reliable in its work. An iron stand supports two polished uprights of about 16 inches in height, and these at the top hold in position a funnel-shaped reservoir, which will contain about a quart; from the bottom of this projects a bright brass tube, some 6 inches in length, having marked upon it gradations of measures in a descending scale. Over this tube is a chimney-glass, at the bottom of which is fixed a spring and contracted spout. This is fixed by means of a cross bar that slides up and down the upright supports, and this

again is kept in its required place by means of small thumb-screws. The position of the top of the chimney-glass in regard to the scale-marks on the tube marks the exact quantity to be measured. The paper packet is held in one hand, whilst with the other the spring is forced back, and this movement allows the seed to fall into the former; the return of the spring to its place again releasing the required quantity of the seed in the tube above; in this way packets might be filled with great rapidity. It is found that once the slide is set to the required quantity

the spikes, about 6 or 8 inches in length, are thickly studded with pale rose and white flowers. They are very useful for cutting, and have a very pretty effect in the garden. The superiority of Mr. KNIGHT'S variety of the LAURUSTINUS is also very marked, the flowers are larger, of a purer white, and the footstalks of the flowers are also much paler. This variety has been named PYRAMIDALIS.

— Mr. MEEHAN states, in his *American Gardeners' Monthly*, that while a frost on August 24

ORIENTALIS SEMPERAUREA in pots, richly coloured, which have taken on a sheen not to be had in this country at this particular time of the year. They have been imported from Normandy, and probably owe their bright colouring to the brighter skies and clearer atmosphere of that district of France.

— At the last meeting of the Linnean Society, Mr. THESELTON DYER exhibited a seed of *Eutada scandens*, and one possibly belonging to *Cyathocalyx Maingayi*, an Anonaceous plant, found in the intestinal

FIG. 152.—THE LARGE WALNUT TREE AT MENTMORE.

there is not the slightest variation in the successive quantities, and that so far its work is perfect. It is evidently inexpensive, as its construction is simple, and it is probable that the Messrs. HARRISON will shortly place it in the hands of some suitable agent to offer it to the trade.

— There is at present a large number of bushes of *ERICA CODONODES* in flower in Mr. KNIGHT'S nursery at Hailsham. This species, a figure of which is given in vol. vii. n. s., p. 463, is a native of the South of Europe, and is quite hardy in favourable situations; some of the bushes are 3 and 4 feet high and as much across; they are now in full flower, and

destroyed Dahlias and similar things in England, Dahlias, Honeysuckles, Scarlet Sage, and Pelargoniums were in bloom, and bright-leaved Coleuses, and other things were still giving a charm to his garden at Philadelphia on November 5. Says Mr. MEEHAN—"There are many beautiful features in English gardening which make an American's heart pine with envy, and our object in making this comparison is to show that we have some good things also. There are few more enjoyable things in the world than an American garden in autumn."

— On looking about Covent Garden Market one cannot but be struck with small plants of *TIUJA*

appendage of a *Rhinoceros sumatrensis* from Chittagong, which died in the Zoological Society's Gardens, Regent's Park. He likewise showed fruits of *Onocarpus vitiensis* obtained from the crop of a Fruit-Pigeon (*Carpophaga latrans*) from Fiji. The curious circumstance is that these should have been so perfect after having been retained within the alimentary canal for doubtless a considerable period.

— Mr. J. SAUL, of Washington, U.S.A., states, in the *Gardeners' Monthly*, that the beautiful *IDESIA POLYCARPA* has proved to be quite hardy during the past three winters. The tree, says Mr. SAUL, will be largely planted when better known. It is of rapid

growth, with clean, shining, green foliage, which stands the hot American summers without burning or being in the least injured—of great importance in foreign trees—and so far no insect has touched its foliage.

— Mr. EDMOND DRAGE, 59, Borough, London, S.E., has sent us the following communication with reference to the SEED-DOCTORING case reported in our last issue:—

"I observe that my name was introduced into your report of a case decided last Monday before Mr. Benson at the Southwark court, and as it may cause some misconception to my prejudice, I shall be glad if you will allow me to state that the seed in question, purchased from me, was quite genuine and unadulterated at the time of sale, and that I had no connection with the case in question, neither had I the slightest idea for what purpose the seed was purchased."

— With reference to the RHEA FIBRE, mention of which has been made from time to time in our columns, we have the pleasure to publish the following particulars, as to the growth of the plant (*Böhmia nivea*) in this country, from Mr. ARKWRIGHT, of Leominster, who has obligingly furnished us with them:—

"In 1873 I received from the India Office, Product Department, some seed upon which to experiment, in order to see if it was hardy in England, and to supply fibre in the green state for the machine inventors. The prize of £500 for a machine which would properly separate the fibre was first offered by the Government of India in 1872, at Saharanpore, and at that time lapsed owing to no competition. It has, I am told now, been renewed for trials in England. I raised the seeds in pans in heat, and planted them in rows about 2 feet apart. Here they have been ever since almost forgotten. I have not even tried how many crops I can get in a year. In India I believe they cut four times. The appearance of the plants is that of a giant Raspberry, throwing up about twelve canes from each plant to the height of 8 feet. Why it is called 'grass' I cannot imagine. The roots resemble those of a Dock or a bunch of long Parsnips joined together at the heads. Each of my three-year-old plants will divide not more than four or five times, so that, unless seed can be grown in England or imported from India, the reproducing powers are very limited. My plants have never blossomed. I am now going to try the effect of sewage and of more exposed situations than any yet tried, and shall probably have plenty of canes to send to experimenting machinists next summer. I enclose a sample of the fibre, as they want to get it. *John H. Arkwright.*"

— A race of dwarf JAPANESE CHRYSANTHEMUMS has been spoken of, but it is not difficult to so manage the tall-growing varieties as to have flowers on quite small plants. Cuttings taken in July, if struck quickly and grown on well, will flower in October and November on plants from 20 to 30 inches in height, and produce good flowers too. It is sometimes convenient to take off the suckers from a choice variety during the summer, in order to throw as much strength as possible into the production of flowers; another advantage is gained by doing this, the stock is materially increased also, for the summer-struck cuttings, by being grown on vigorously, in due time give forth suckers also. It also suggests how a succession of flowers can be had up to a much later period than usual.

— According to the *Revue Horticole*, two JAPANESE GARDENERS have already arrived in PARIS with a stock of Japanese plants, in readiness for the International Horticultural Exhibition of next year.

— The PRIMROSE family appears to be in a considerable state of uncertainty as to its seasonal duties. It is stated that in Kent, as in other parts of the country, Primroses in the hedgerows are in full blossom; and in gardens they are putting up autumn trusses in plenty. Especially is this true of seedling plants put out in the summer to bloom in spring. Owing to the wet season they got well established in the soil; then came a spell of dry weather, which ripened the growth, and this, followed by mild and open weather and genial rain, has induced a kind of unseasonable floriferousness. If some of the most promising varieties were lifted and put into small pots, taking care to break away as little soil as possible from the roots, they would flower in a cold house or frame all the winter, as they require protection only from frost and rain.

— The *Scientific American* says that the plan of turning the tops of houses in cities into gardens has been carried out at the Palmer House in Chicago, and a portion of the roof of that hotel is now covered with a large conservatory. The structure is entirely of glass and iron, and it is built on an extension; its location is such that it opens directly out of the fifth-floor corridor of the main edifice, which rises some two stories above. A fine collection of tropical and rare plants has been provided, and the regular heating apparatus of the house supplies ample warmth. The conservatory is open to guests of the hotel, and furnishes a delightful resort.

— *DRACENA AMABILIS* is about one of the most beautiful of this large group for decorative effect in mid-winter and early spring. In one of the houses at the Ealing Dean Nursery, Mr. H. B. SMITH has a number of exceedingly handsome specimens, from 2½ to 4 feet in height, that are now exquisitely coloured; and shortly the plants will be sent to market, where they command a very high figure. This variety will not colour in a small state, like *terminalis* does, and so it requires to be grown to a good size to see it in all its beauty. The plants began to colour in September, and in another month or so will be at their very best. It is considered to be rather harder than *terminalis*.

— The tree represented in the accompanying illustration (fig. 152), is the finest old specimen of a WALNUT TREE that we are acquainted with. It grows near one of the drives at Mentmore Towers, Bucks, the palatial residence of the late Baron MAYER DE ROTHSCHILD, and now of Miss ROTHSCHILD. It has a spread of branches of about 300 feet in circumference, and measures some 50 feet in height. Its exact dimensions are not known to us, but we should be glad if Mr. SMITH would enable us to put them on record.

— *CHRYSANTHEMUM MRS. GEORGE RUNDLE* is undoubtedly the best and purest white kind for market use as a cut flower, and the best habited kind for pot culture. A lot of about thirty plants, strong and full of buds, lifted with large balls of soil from the open ground at the end of October, and planted up in a soil bed in a span-roof house, have produced trusses of bloom literally by bushels, and which have proved most valuable for all the purposes to which flowers at this time of the year can be applied. Even the smallest side-shoot produced its flower, the entire cutting extending over a month. Had it been desirable the time might have been considerably extended.

— Mr. MEEHAN continues his interesting European notes in the current number of the *Gardeners' Monthly*. The subject of his present remarks are the nurseries of Messrs. MITCHELL & SON, Pitdown; Messrs. CUTBUSH & SON, Barnet; Mr. E. S. WILLIAMS, Holloway; Mr. WARE, Tottenham; Mr. BULL, and Messrs. VEITCH & SONS, Chelsea.

— At Mr. KNIGHT'S nursery, Hailsham, and also in the nurseries of Messrs. SCOTT, at Eastbourne, the only PERPETUAL FLOWERING CARNATIONS grown in quantity are LA BELLE, and a pale rose-coloured sort named ANNIE WILLIAMS. The last-named variety grows with great freedom, and produces its pretty, fringed flowers abundantly.

— The Covent Garden FLOWER MARKET will be opened at 5 A.M. on the morning of Monday next.

— Mr. TURNER, of Slough, had the honour of supplying the floral decorations which made HUGHEN DEN MANOR so gay on the occasion of HER MAJESTY'S visit to the Prime Minister on Saturday last. To commemorate this special mark of royal favour, trees were planted on the lawns by the QUEEN and the Princess BEATRICE, the subjects selected being *Pinus nobilis* and *P. Nordmanniana*, which were also furnished by the Slough nursery.

— A continuously wet AUTUMN AND WINTER is much more injurious to hardy plants than severe frost. Last winter, owing to the excessive rainfall, Pinks, Antirrhinums, &c., died in large numbers on wet lands; and this autumn, from the same cause, old-established plants of the COMMON PINKS, grown for market purposes, are having a bad time of it; as they are generally grown under tall fruit trees, there is the addition of drip from the trees as well as wet at the

roots to contend with. We can understand from this why it is the cultivators of the florists' Pinks always advocate a rather raised and well-drained bed for the plants, so that they may pass through the winter in safety.

— Some TEA ROSES that now entirely fill a lean-to house at Syon show Mr. PRINCE'S SEEDLING BRIARS as stocks in a most meritorious aspect. The growth produced has been remarkable, the main stems are of great size, and shoots have broken out from these of the most robust kind, and their branches have gone to the top of the house. These plants were put in a year ago last February, being then of the usual nursery size. *Maréchal Niel* has made a growth that is simply marvellous for a Rose. The main stem, where it is brought into the house from the outside border, has attained to the diameter of a man's wrist, and it is evident, if allowed, that the plant would entirely fill the house in another year. The growth is trained direct to the top of the house, and is full of buds that are now, under the influence of a gentle warmth, fast plumping up. It is needless to say that with such results Mr. WOODBRIDGE holds the seedling Briar as a stock in the highest estimation.

— Among the rarer products at this season of the year in COVENT GARDEN, we notice there are GREEN PEAS and NEW POTATOS, &c., among vegetables. Under an arch of fine Pines, Mr. WEBBER has two large bunches of Grapes, "Barbarossa," weighing some 15 lb., and were favoured by Mr. GARCIA with a sight of some 5000 or so of splendid fruits of Easter Bénédict Pears, as also of some variegated Pines from St. Michael's, immense Shaddockes from Nassau, fine spikes of Bananas from the Canary Isles, and some Brazilian Oranges, which are about the size of Pomeloes, and are of fine flavour.

— The fine old climber, *BIGNONIA VENUSTA*, is now in bloom in one of the cool houses of the crescent range at Syon, and finely displays its fitness for roof decoration of conservatories during the winter months. Trained with a due regard to its habit when in bloom, the floral branches hang down to a length of from 2 to 3 feet. One branch at the time we saw it was of the latter length, and covered with large bunches of bright trumpet-shaped orange red flowers throughout. Although the old flowers of each bunch soon drop, yet there are so many of them that a succession is long continued. Gorgeous as many greenhouse climbers are in the summer, there are few that could eclipse this *Bignonia*, but when its beauties are found in the highest perfection in midwinter, its value as a decorative plant can hardly be over estimated.

— A few years ago, a First-class Certificate was awarded at one of the spring meetings of the Royal Botanic Society to a bright BRONZY-LEAVED SWEET WILLIAM that is much grown round London for spring sale. It was by no means new, but it was novel to the judges on that occasion, hence the award. In West Middlesex there can now be seen patches of it that are most effective in appearance, with a peculiar bronzy sheen spread over the leaves unlike that seen on any other plant. As long as it retains this fresh and bright appearance it is highly effective, and it appears to possess good staying powers. Very early in spring, when growth sets in, it loses its striking character, and ceases to be so valuable from a decorative point of view. The flowers are small and insignificant, the plant being grown wholly for its foliage.

— We have received the following communication relating to *CARLUDOVICA DRUDEI* from Mr. W. BULL. It will be remembered that M. LINDEN claims to have introduced the plant previous to Mr. BULL, and to have catalogued it under the name of *C. speciosa*. But if this be so, and M. LINDEN'S plant proves identical with that of Mr. BULL, which seems doubtful, the name we gave will still stand, as a catalogue name, without any description, is useless for purposes of determination:—

"King's Road, Chelsea, London, S.W.
"CARLUDOVICA DRUDEI.—Referring to a paragraph respecting this plant at p. 753 of your last week's issue, it is quite possible that M. LINDEN may have imported this plant; it does curiously happen, however, that last September I received an order from the South Australian botanic garden for (among other plants) *Carludovica speciosa*. I have no such plant, and do not catalogue

it, but seeing the name in M. LINDEN'S catalogue, I wrote to him for a plant. He replied that he could not then supply it. Being anxious to obtain it to complete the order, I then wrote M. VAN HOUTTE for *Carludovica speciosa*, and received a plant from him with bipartite-acuminate leaves, a totally different thing to my *Carludovica Drudei*, and also different to any of the other *Carludovicas* in my collection, for I have three or four *Carludovicas* from my collectors in the United States of Columbia, and, therefore, particularly noticed the plant sent me from Belgium. Since reading M. LINDEN'S remark, I have written to M. VAN HOUTTE, asking if he is sure he supplied me with the right plant. His reply is, that he obtained it from M. LINDEN. If, however, M. LINDEN will send you, by post, a leaf or two of the plant he refers to, its nomenclature could perhaps be correctly determined.

"WILLIAM BULL, F.L.S."

— The Annual General Meeting of the GARDENERS' ROYAL BENEVOLENT INSTITUTION will be held at the Bedford Hotel, Covent Garden, on Friday, the 18th of January next.

— Mr. JAMES GRAHAM, late gardener at Garscube, near Glasgow, and for some time nursery foreman with Messrs. JAMES DICKSON & SONS, Edinburgh, was entertained by a number of friends on the 12th inst., and presented with a purse of sovereigns as a token of their respect and goodwill on the occasion of his leaving the service of Lady CAMPBELL to begin business as a nurseryman in Glasgow, in company with Mr. GALLOWAY, the famous Scotch Gladiolus grower.—Mr. ROBERT FLEMING, lately gardener to J. C. WAKEFIELD, Esq., Eastwood Park, Glasgow has succeeded Mr. JAMES GRAHAM, as gardener to Lady CAMPBELL, of Succoth, at Garscube.

Home Correspondence.

Copings for Garden Walls.—As the coping of garden walls seems to occupy attention in your columns of late, I have thought it might not be amiss to give my experience in the matter. When I entered on my present situation a portion of the walls was coped with stone and a portion with wood, in both cases projecting 8 inches, but, as Mr. Caie observes (p. 725), "excluding the light, and baving at the top of the wall a bare unsightly appearance," besides losing a portion of the best of the wall. About eight years ago I recommended my employer to try a part of the wall coped with glass, which he at once agreed to do. Having procured about 50 yards of glass, 4 feet long, 12 inches broad, $\frac{1}{4}$ inch thick, the stone cope was put back perpendicular to the face of the wall, a groove taken out underneath it, and the glass put in 4 inches under the cope and filled with cement, thus leaving 8 inches of the glass for protecting the trees. This, with a screw cover, keeps the blossom safe from 10° of frost, and, so far, was successful; but still it did not obviate the objection I had all along held against a permanent coping as a means of harbouring and encouraging insects, such as white and brown scale, green-fly, &c. In winter it protected them from harm, as they had nice dry quarters when they might have been encased in a coat of ice after a shower or snowstorm; and in summer, instead of the foliage getting the benefit of the rains, the coping threw it completely over them. There are few places where the wall trees get the amount of attention desirable in the matter of syringing. Why, then, prevent Nature's syringing from doing its beneficial work? With the hope of obviating these objections, I proposed to my employer to have the coping so constructed that it could be put off or on at pleasure. I was desirous to have a portion done, as I wished to see how it would succeed. Last summer we had about 100 yards done in wood frames, 10 feet long and 9 inches broad, the back and front frame-work occupying 4 inches, thus leaving 5 inches for glass, so as to let in light to the trees at the top of the wall. The frames are held together by iron, so that there are no astragals. The glass is laid end to end, in any lengths most convenient. At each end of the frames the iron which keeps the frames together is bent up the thickness of the stone cope (which projects 1 inch, so as to allow the glass frames to drop in underneath it, to carry the drip from the stone cope over the foliage), so as to allow a joint to be formed with a piece of iron bolted into the cope of the wall, and projecting so far as to meet between two of the frames. A bolt put through the hole formed in each, enables them to be turned on to the top of the wall when not wanted on the trees. At present they are all laid over on the top of the wall, exposing the trees to the winter's cold and rains. In spring they can be turned over on the trees in a few minutes, and left

there till the end of May, or beginning of June; then put back on the top of the wall to let the trees get the benefit of the summer showers; put on again in autumn to protect and keep dry the ripening fruit. As soon as the ripened wood indicates maturity, they can have the benefit of full exposure, which also helps to retard the trees in spring, a matter of great importance in these northern regions. *D. Doig, The Gardens, Rossie Priory, Inchture.*

Veitch's New Protecting Broccoli.—I am highly pleased that the Fruit Committee of the Royal Horticultural Society has awarded a First-class Certificate to this most excellent variety. I have this season grown it largely, and find it most useful in filling up the gap between the Autumn Giant and the good old Snow's Broccoli. I find in growing all kinds of Broccoli that land highly manured is most objectionable. I always plant on land that was manured well for the previous crop, for the reasons that they grow too rank, and, instead of eating marrow like, they are particularly strong in flavour, and inferior generally. Another reason is that rank vegetation is of course sappy, and the frost takes hold of them in a far greater degree than on good hardy shrub plants. *R. Gilbert.*

Gilbert's Selected Snow's Broccoli.—Last January Mr. Gilbert kindly sent me a pinch of his Selected Broccoli, and for which I now beg to return him many thanks. The worst I can conscientiously say of it is that it is a decided acquisition, and ranks A 1 amongst early Broccoli. This year I sowed and planted out at the same time some of Snow's Early Winter White, Veitch's Autumn Self-protecting, and Gilbert's Selected Snow's Broccoli, but notwithstanding the high reputations of the two former the latter came in first. I shall not attempt to describe it (but leave Mr. Gilbert to do so) further than saying that I consider it "something" between that excellent Cauliflower (when it behaves well, which it has done this year) Veitch's Autumn Giant and Snow's Early Winter White Broccoli. Gardeners will know of what use the "something"—shall I say Gilbert's "Nonsuch?"—is likely to prove when it is stated that it comes in between such sorts as Veitch's Autumn Giant Cauliflower and Snow's Broccoli. I do not think that this excellent variety is in commerce yet, but if not I hope Mr. Gilbert will soon supply the trade with it, thereby conferring a great boon on gardeners, who would have just cause to thank him for doing so. *J. W. W.*

The Gravenstein Apple.—Is it not strange that this Apple is not more planted? I fancy it must be on account of its not being known sufficiently. I would, therefore, beg to call attention to it, as the most delicious autumn Apple I know, sugary and pleasant to a degree; and indeed, in some seasons, and in good situations, it eats more like a Pear. In sounding its praises, I am not running against the Ribstone, nor its off-spring, the Sturmer Pippin; and I know the value of the Golden Knob in April; and the "Wise Apple," Court-Pend Plat, Cux's Orange Pippin, and a host of good winter and spring kinds; but what I say is, that if the soil is suitable, and the climate tolerable, the Gravenstein will come to table as a dessert Apple, in the autumn, second to none. *J. Rust, Eridge Castle.*

Desfontainea spinosa—It is here, in the north of Ireland, quite hardy, but so slow in growth as to be quite unfit for planting largely for any effect, and, for hedges, I would say "don't." The healthiest plant I think I know of is on a wall, in a very favourable situation. I have known it about seven years, and it is now only about 3 feet high; it is bushy, though, and flowers beautifully every year. It also grows in the open border about an inch annually, but flowers withal, and is pretty. Certainly there would not be much labour required to keep it in order by clipping. Some of the handsomest hedges in this neighbourhood are formed of *Berberis Darwinii*, and they are very charming. *T. Smith, Newry.*

— I have seen *Desfontainea spinosa* grow and flourish in the west of Argyllshire, without any protection, but I can't say whether it blooms there or not, as it is generally in the winter that I visit the Highlands. *D. B., Woodloch.*

— In answer to "W. A." (p. 695) I beg to say that I am in earnest with regard to the *Desfontainea* either as a hedge or bank plant, and as a proof I will plant a bank of rockwork with ten dozen plants put in as cuttings last February. I prefer this position for the simple reason that I have such a bank to plant next spring. "W. A." will see at a glance that such a position is not the best for quick growth, and to define our position I may say we are nearly 600 feet above the sea-level, with another 350 feet added to the south-west, on the top of which *Rhododendrons* are growing beautifully, and I hope to have *Desfontainea* growing next year at 930 feet above the sea. The plant that has flowered so well here this year

measures 3 feet 9 inches in height and 4 feet in diameter, and the longest annual growth 9 inches. It is not the most robust plants which flower the best. There ought to be a fine specimen of this plant at Hewell Grange, in Worcestershire. I left a fine healthy plant in a No. 8 pot twenty years ago, and the late Mr. Markham promised to have it planted out. If he did so, and this should catch the eye of the present gardener, will he please state the size, &c. The plant in question was sent out by the Royal Horticultural Society. *G. Doit, Woodstock Park, Kilkenny.*

Aponogeton distachyon.—This is, no doubt, quite hardy in most parts of Britain, but there is a special reason why it can never become common, at least in moving water. It seeds freely, the seeds sink to the bottom, there germinate, and as soon as they have formed two leaves rise to the surface, and, if there is any current, float away. The young plants do not appear to possess the power of attaching themselves firmly below, so as to resist the floating tendency of the growing leaves. *T. Smith.*

Seaforthia elegans fruiting at Endcliffe Hall. —A noble specimen of this elegant Palm is flowering and producing seed in Sir John Brown's garden at Endcliffe Hall, Sheffield. Five beautiful drooping clusters at the foot of the leaf-stalk adorn the stem. The bright red seed pods have a grand effect. *A. O.*

Laurustinus and Arbutus Unedo as Seaside Plants.—These shrubs are really unsurpassed in the neighbourhood of Colwyn Bay, Llandudno, &c. The *Arbutus* here has a beautiful crop of fruit in all stages of growth, but the late flowers are now fast losing their beauty. The old plants of *Laurustinus*, which are very large at this place, are charming to behold, as, although many feet above the sea, they are one mass of bloom. Holly berries are so thick on old trees that the foliage is scarcely visible. Of the yellow-berried variety there are many bushes here from 10 to 20 feet high, heavily laden with fruit, and forming a beautiful contrast intermixed with the scarlet. *Fuchsias*, of which there are many large bushes in the shrubberies here, are still blooming, *Pelargoniums*, *Calceolarias*, *Stocks*, *Salvias*, &c., are blooming freely. The Myrtle seems to enjoy this locality. It grows grandly at this place. There has been snow on the distant mountains more or less for the past three weeks. *T. Capers, Bady-gallen, Conway, North Wales.*

The Gros Colman Grape.—I, like "Grape Grower," was for giving this noble Grape a bad name last year, and was about to cut it out of one house of Vines, mostly Muscat of Alexandria, but my employer thought it best to try it once more, as the berries were large, the colour good, and the bunch a noble-looking one altogether, though not much in flavour. So we gave it another chance, and this year on the same Vine we had six bunches, small in size, though the berries were large, and, to my employer's taste, first-class in flavour. I have canes of Gros Colman, Alicante, Lady Downes, and Black Hamburg, which were planted on May 3, 1876, and cut back and started in the last week in March, 1877, and produced a bunch or two on each rod. I find that, although the Black Hamburg is at the coolest end, Lady Downes next, Alicante next, and then Gros Colman, the Hamburgs were ripe about ten days before the Lady Downes, the latter fourteen days before Alicante, and the Alicante twelve or fourteen days before Gros Colman, so that to do Gros Colman well it wants a long time and plenty of heat; and to my mind it should be grown in a house by itself, as there is something about the foliage which seems to want different treatment to the others, although I now believe it to be a good Grape; but of the three I like Alicante the best, and should plant it in preference to the others. *J. Lane, Pyrgo Park, Romford.*

Strawberries all the Year Round.—There is little doubt but that Strawberries by proper management can be made to fruit all the year round, but as to their flavour in the winter months it is totally wanting. By keeping the earliest forced plants of *Vicomtesse Héricart de Thury* under protection until the end of May or June, and then planting them out in well-prepared soil, they will produce good dishes of fruit in August and September. Some of the best and strongest forced plants might likewise be kept in pots, and after giving them a shift and keeping them in the open air in a shaded situation, they will ripen fruit in October and November by keeping them in a frame or forcing-pit. In the months of December, January, February, and March, I have never found Strawberries of any of the sorts to have any flavour in the fruit, and it is only in April when they begin to give out the aroma peculiar to them. Perhaps the old Keens' Seedling, when forced so early, is as good in flavour as any *Vicomtesse Héricart de Thury*, Eclipse and President coming next; and I am likewise forcing *La Grosse Sacré*: this year as an early kind,

For forcing the main crops to ripen in May, June, and July, I find Lucas, La Constante, Sir Joseph Paxton, Dr. Hogg, and British Queen, the best; in fact, British Queen is still the best-flavoured and noblest of all Strawberries when grown well. *William Tillery.*

The National Rose Society.—I read with regret the Rev. Mr. Camm's remarks in your impression of the 15th Inst., and with some surprise your supplementary note. At the inaugural meeting of this Society, on December 7, 1876, rules were drawn up, and agreed upon; and by rule 6, it was decided that "the annual meetings of the Society should take place on the first Thursday in December," and circulars containing the rules were forwarded to the members. The very existence of the Society is so dependent on thorough unanimity existing amongst its members, that any importation of personalities or private differences is greatly to be deplored. Having the conduct of an anxious and arduous business, I was compelled to resign my position as co-secretary with the Rev. Mr. D'ombain, finding it was impossible for me to devote the amount of time and attention which the interests of the Society demanded. I am happy to add that the Society is to be congratulated on having secured the services of Mr. Edward Mawley, to whose ability and energy during this, the first year of its existence, it is in no small measure indebted. *Hovace K. Mayor, Winchmore Hill.*

Stacking Strawberries and Storing them in Bottom Heat.—Recently a controverted point has arisen in relation to the utility of bottom heat for early forced Vines, and, while the subject is being discussed, I think it might with advantage be extended to the Strawberry. The practice of stacking, or storing away Strawberry-pots in winter, is an old one, and, like many other old principles, is hard to shake off. Those who advocate the system have no doubt practised it with some measure of success, and perhaps may have commended it to others through the columns of the horticultural press, although in a somewhat modified form. The system is either beneficial, or it is not. There is cause and effect in the most minute point that can be raised on any question, whether it relates to gardening in its scientific or most simple form; and no one cares to admit that certain principles are put in practice on no better grounds than that other people do the same thing. On the assumption that science and research requires every man to think and act for himself, I proceed to inquire for what reason Strawberry-pots are stacked, and what is the benefit to be derived thereby? I assume the plants to be well grown and well ripened, and the pots thoroughly drained, and standing on a porous bottom. Do these conditions not render them frost-proof? They have crowns plump and hard, with a tinge of perfect maturity about them that is never seen in the open ground; their leaves are of that leathery texture which indicates early growth under favourable influences. Their pots are bursting with healthy roots that were fed and cherished with the utmost care and patience, and set apart at such distances that no obstruction was possible to impede the healthy influence of sun and light, and yet these plants are supposed to require protection, when those in open quarters are left to take care of themselves. These two principles are hardly consistent, except on the plea that pots require protection from severe frosts, which is admitted; or where the autumn rainfall is known to be so excessive as to interfere with a free course of drainage, amounting to something like saturation. These are, however, contingencies that must always be left to the judgment of the cultivator. Severe frost before New Year's day is now a thing of the past, and no amount of wet will ever unripen a ripe crown or otherwise disturb a healthy intercourse between root and leaf. There is the probability of growing showers between autumn and winter; but the remedy is simple. Take the opposite view, and judge by comparison on natural principles from facts as they present themselves in actual practice, and see how far the situation will tally with the natural order of things already referred to. Let the pots be stacked in frames or against walls—which is a more common practice—or suppose them to be set in the ordinary way on the ground, or on shelves in orchard or other cool houses. Can any one doubt, that with open ventilators day and night, the effect of those sweeping dry currents on porous pots bursting with roots can be other than detrimental? I have unstacked Strawberry pots over and over again, and always found the roots of an iron-brown instead of a fleshy white; but some one may say this is the result of artificial cultivation! Yes; it is exactly the same as irregular organic action in the human system, it means that want of proper sustenance for a time—though there is unobserved internal sympathy—is not transparent to the naked eye; or it may mean that temporary paralysis of unity between root and leaf is not observable when the latter is hard and leathery, and from the influence of any trying element, such as solar heat. But can any one doubt, if my argument be correct, that

the plant suffers in a proportionate degree to the loss of its roots, and is so much feeding power lost on the plea of preservation or rest, the latter a perfectly natural condition and perfectly consistent with an abundant supply of water at the root and breathing the natural atmosphere of winter. Proceeding to discuss the question of bottom-heat, it must be admitted to be a powerful exciting agent in making roots, and is the only safe course to pursue when root-action is found to be deficient; but assuming a healthy supply of active roots, the application of bottom-heat is only a premature disorganisation of sap, which is wasted in making what Nature had already supplied herself with in adequate quantity, or, in other words, the latent power of the plant, which should go to develop a crop, is prematurely wasted in making roots. *W. Hinds.*

Mitchell's Convertible Garden Ladder.—The season has now arrived when the pruning and training of fruit trees of all kinds demand attention. In all gardens, but more particularly in gardens of considerable extent, the performance of these necessary operations requires considerable time, as well as patience, at a season of the year, too, when the state of the weather is often such as to seriously interfere with the personal comfort of the operator. It follows therefore that the invention or contrivance of any implement or requisite, which may be likely to facilitate or expedite the performance of those operations, will be sure to meet with a hearty welcome, when their merits become fairly known. My attention has been

FIG. 152.—MITCHELL'S CONVERTIBLE LADDER.

directed to this new form of ladder, invented by Mr. Mitchell, Brandon, Suffolk, which promises, I think, to be an exceedingly useful piece of garden furniture. It may be called a *multum in parvo*. It is at least a combination of a set of steps, and garden wall ladders of various lengths. When used as an ordinary wall ladder it can instantly be increased to double its length, and being in sections, can be further increased in length to any desired extent by adding section to section, or stave to stave. It is provided with a receptacle for the purpose of containing nails, shreds, &c., and thus dispensing with the use of the nail-bag. As a set of steps it is also very useful, being so constructed that it cannot give out at the foot, and is consequently quite safe to use for the purpose of pruning standard and pyramidal fruit trees, and for gathering fruit, &c. It has also the advantage of being light as well as strong, and is easily unconnected when not required for use, and it can be readily stowed away in a very small space. *P. Grieve, Culford.*

Winter-Flowering Decorative Plants.—When recently visiting Hatfield, the seat of the Marquis of Salisbury, I was much struck with the numbers and quality of the plants grown for decorative purposes. They are grand examples of cultivation, most of them being grown in 4½-inch pots. The subjects are *Begonia Ingranii*, nitida, semperflorens, and *Euphorbia jacquiniiflora*, very fine, feathered with foliage quite to the soil, and with spikes of flowers over 18 inches long; *Poinsettias*, with foliage down to the pots and grand heads of scarlet bracts; *Rivina humilis* and *tinctoria*, their bright scarlet berries being very showy; *Thysacanthus rutilans*, with its beautiful drooping racemes of scarlet flowers, very effective;

Justicia speciosa, also as useful; *Calanthes* in variety, and some very fine spikes; a grand batch of seedling *Gloxinias* in 48-pots, some with a dozen beautiful flowers—at this dull season they will prove very useful. *Calla aethiopica* is grown by the hundred, and some will be just in for Christmas. A succession of all these useful plants is kept up for a considerable time, for they are grown by the hundred. In the conservatory a fine plant of *Luculia gratissima* is producing and has expanded several trusses of its beautiful sweet-scented delicate pink flowers. What a pity we do not see this grand old plant more generally grown. In passing through the kitchen garden I noticed that it was well stocked with a good succession of vegetables; and I am glad to state that Hatfield gardens are greatly improved under the practical superintendence of Mr. Norman, the gardener. *A. O.*

Lapageria alba.—Through the kindness of Mr. McInlay, gardener and steward to Mrs. Hanbury, Bedwell Park, Hertford, I enclose you a leaf of *Lapageria alba*, which I consider something extraordinary. The plant was planted out three years ago. This year it has made a shoot, the growth of which is upwards of 12 feet long. The leaf enclosed is a sample of the majority of the foliage developed in the shoot. The plant is producing a fine crop of flowers. *A. Outram.* [The leaf measured 5 inches in length and 4½ inches in width at the widest part. EDS.]

Covering Early Vine Borders.—Permit me to ask those of your correspondents who record the success of uncovered Vine borders for early forcing, to state the age of the Vines, how many years forced, at what time the fruit is ripe, and the nature of the soil—whether light or heavy. My own experience of several years, so as to have ripe Grapes in May, is decidedly in favour of a moderate covering with fermenting materials, both on inside and outside borders. But as I am (like many other gardeners) desirous of doing away with all unnecessary labour in the gardens under my care, I wait with some impatience your correspondents' views on this subject. At the same time those who advocate the plan of uncovered borders should have practised it for say five years with the same Vines, and in the same garden, before they can expect practical men to receive their views with any respect. I also think that Grapes which are ripe during the months of April, May, and the first week in June, should only be considered as early Grapes in this matter. Will *Scotia*, see p. 757, kindly give us the name of the Grape that he starts the second week in January in a temperature of 50°, and cuts ripe fruit from in May? that is in eighteen weeks from starting, which I think most of your forcing correspondents will agree with me in thinking is very quick work. *H. F. C. Grimston.*

Pronunciation of Latin Plant Names.—May I suggest that sounding the *t* in Latin names as *sh* or *ch* is a bit of slipshod pronunciation, which probably took its rise in the George IV. period, when it was fashionable to pronounce "beauteous" or "court-teous" as "beauchus" and "curchus," a fashion which, both in Latin and English, is now happily in rapid process of extermination. It may be true that the *p* in such naturalised words as "pseudonym" and "psychology" is by most Englishmen (who of all nations are the most inarticulate) dropped in pronunciation, but such practice is not necessarily right, still less does it follow that it is right to drop it in botanical names, which are not naturalised words. There will always be a dispute over *Gladolus* and *Gladolus*, but I think that in all countries except England the first prevails entirely. *R.*

Hybrid Ivy-leaf Pelargoniums.—I have sent you some flowers of my hybrid Ivy-leaf Pelargoniums to show you how continuous they are in flowering, as the same plants have been in flower from the early part of May, and are likely to continue for some weeks longer in a cool greenhouse. I think Gem would be very nice for bouquet-making. [Yes.] I have not had a flower on the true Ivy-leaved varieties for four months past. *J. George, Putney Heath.* [The varieties received were Gem and Nemesis, and both are very beautiful. EDS.]

New Flowers of the Year.—A thoroughly complete and trustworthy descriptive list of the new flowers of the year is badly wanted. The *Gardeners' Year-Book* professes to give this, but the list is so loosely compiled, the inaccuracies so manifest, and the omissions so noticeable, that it cannot be accepted as authoritative. Besides, many things that have not appeared in public are given with only the raiser's descriptions appended to them. Take the list of bedding *Violas* for instance. It is doubtful if one of those given in the *Year-Book* was included in the trial carried out at the Chiswick Gardens during the past summer, and not one of the varieties certificated at Chiswick by the Floral Committee appears in the list. Long lists of show and fancy *Pansies* are given

on the authority of the raisers. Fuchsias, Gloxinias, Pentstemons, Pyrethrums, and Roses, are similarly served up. Six of the show Pelargoniums certificated by the Royal Horticultural Society find no place in the *Year-Book*, nor do some sixteen certificated varieties of the Zonal section, while double-flowered varieties are omitted altogether. X.

Chamaeladon oblongifolium.—There is no plant published under this name, but we had a plant at Kew grown under that title, which I have considered to be *Chamaeladon lanceolatum*, Mig., described and figured in his *Pl. Ned. Ind.*, iii., p. 212, t. 40, a native of Java. It is a very curious little Aroid, and produces its small green inflorescences freely, but I have never observed the spathe to open, nor have the gardeners who have charge of the Aroids at Kew, and it does not appear to produce fruit, so it is probable that it requires a different treatment to enable it to perfect its flowers. *N. E. Brown, Herbarium, Kew.*

Flooring for Glasshouses.—Those who have anything to do with forcing and plant-houses in which much water has to be sprinkled on the pathways and other surfaces for the purpose of causing a moist state of the atmosphere, will know what a source of discomfort it is to visitors and others not so much engaged in the work, and what an endless labour it causes in keeping the floors clean and free from green slimy growth after they once become thoroughly saturated. This was the case here till I happened to meet with some highly glazed slate-coloured Staffordshire bricks which are made with an impressed diamond pattern on the upper surface and into the channels so formed what water is used immediately runs, so that any one may at once pass over them without so much as scarcely damping the soles of their boots. There are many things, such as slate slabs and paving-tiles, that look clean and nice for a time, but all are objectionable on account of the sloppy state they are generally in and the labour and trouble they cause in scrubbing and washing them down, whereas with these hard bricks, that are so polished and impervious to moisture, a rinse with a few pots of water is all they require; while as to wearing them out or causing depressions in them though traffic is simply impossible, as I find that although we have had them in use here for fourteen or fifteen years they are now in just the same new-looking condition they were at the time they were laid down. Although I have never seen them in use in hothouses elsewhere, I notice that many of the platforms in and around London are paved with them, thus showing how well adapted they are to stand any amount of traffic; and besides possessing this good quality, their nice neat appearance is a great recommendation to them. Those who may be erecting glass structures, and wish to have real serviceable floors that will entail no farther trouble or expense, cannot possibly do better than use these bricks, and if they are laid on a good solid bottom with a bed of mortar under them they will remain firm and immovable. We have them here both with and without edgings at the side, but I prefer them without, as when placed down the centre of the pathway with a 6-inch margin of bright shingle, Derbyshire spar or white shell, it forms a nice setting from the contrast it affords to the bluish-black colour of the bricks, and not only this, but the water drains gradually off and always leaves a clean surface. If edgings are used there must be a slight fall allowed and drains provided, so that the shingle or spar is desirable in every way, and as the bricks are almost as hard as iron there is no fear of the sides becoming chipped or disfigured, as it is a difficult matter to break or cut them when desired for the purpose of finishing off at the ends. In laying them they should be placed for the diamond pattern to work regular, which it does by breaking the joints in the ordinary way. Unfortunately I do not know who are the makers of these bricks, as it is so long since we obtained them, and it is to be hoped therefore that they will be advertised by those interested in their sale, as they are really the best things for floors I ever met with. Of course for Peach-houses or vineries, where it is necessary for the air and light to get at the border, there is nothing equal to a trellis of iron or wood, but for permanent pathways these glazed Staffordshire bricks are quite unsurpassed. *J. S.*

Tuberoses.—In reply to Mr. F. Barr (p. 691), allow me to state that it is not a very difficult matter to have Tuberoses in flower at this season of the year, and though I consider them tractable subjects at any time, some may do them with less trouble than others. I am so satisfied with my success in a small way that I send you the details of my method of treatment. The bulbs at no time should be exposed to a temperature lower than 45°, and with me they protest against being kept out of the soil any longer than the early part of June. The months of May and June, as a rule, bring some warm days, and the temperature of most sheds and such places naturally rises. I use 4-inch pots, one bulb in a pot, pressed moderately

firm. They are not fastidious as to soil; such a soil as is used for the Tulip or the Hyacinth suits well. I potted some of mine this year in what many would not use for the bulb named. For the earlier flowering I use the same as I do for Pelargoniums, stiffer, and not quite so rich and sandy. Of these I shall say a word further on. Presuming the soil to be in a proper state of moisture—if not so make it—they will then not require water immediately after they are potted, as is the case with some things. I may also add that the bulb is only inserted an inch or so in the soil. Potting completed, they should be placed in the most sunless spot in the garden on ashes, and be covered over with the same or Cocoa-nut fibre, or some such like material. Place a light over them, or something else that will throw off the wet, and when they are through the 3 or 4 inches of covering material that was placed over them, they should be taken out into a pit, greenhouse, or frame, the object being to have command over the amount of water they are to have, which must be cautiously given, until they show signs of throwing up their spikes; more plants become blind by injudicious watering than from any other cause. My loss has been chiefly through keeping them in too low a temperature after they have even showed their buds. In October, and even the latter part of September, they require something between the cold greenhouse and the stove; 50° to 55° is safe. After they start they must be gradually moved on. This with me they do not get until the last of the Melons is out. To bring them on, the forwardest are selected and placed amongst the Pines, the Melons, or Cucumbers, elevating them so that their tops are through the trellis and well above the foliage. Our last lot were put in the Cucumber-house a fortnight ago, with a night temperature from 50° to 55°. They will commence to open in a week. To get them early I plunge them in a bottom-heat of 70° to 75°, top heat 50° to 55°, and when they show signs of growth they should be placed as near to the glass as possible; this may be accomplished by placing more fermenting material on the top of the old. Tan is the best where it is cheap, on account of the regularity of the temperature. As soon as they show signs of throwing up their flower stems, they may be removed from the bottom-heat to make room for others. The early started Tuberoses are more liable to the attacks of red spider, and are therefore benefitted by the daily use of the syringe, and any other means that are likely to counteract the ravages of this pest should be taken advantage of, such as standing the pot on ashes and keeping the same moist. Those showing flower stems in May, June, July, and August may be stood or plunged out-of-doors. I think that by due attention to two or three points in the above remarks, and good sound bulbs from a respectable dealer, success is sure. Avoid by all means the refuse sent to sale rooms, for with this root you will be more disappointed than with anything else. Hyacinths or Tulips may throw some kind of flower, even after being grown in pots the previous year, but not so the Tuberose, which, after having been grown once in pots, I am not aware that any one has found of further use. Ours seldom fail. I would not call one or two in a dozen a failure, especially when some throw two and three stems, as I had them do in 1876. *W. P. R.*

Reports of Societies.

Massachusetts Horticultural: Boston, Dec. 1.
—An adjourned meeting of the Society was held at 11 o'clock, President Parkman in the chair. The President announced as the first business before the meeting resolutions in memory of THOMAS RIVERS, of Sawbridgeworth, England, one of the most eminent European horticulturists and pomologists, which would be appropriately presented by Hon. Marshall P. Wilder, the foremost American pomologist.

Mr. Wilder said—Mr. President, I thank you for suspending the usual order of business, that we may render proper honour to the memory of one of the oldest and most respectable corresponding members of the Society. I am advised by the memorial card, which I hold in my hand, that Thomas Rivers died at his residence, Sawbridgeworth, England, October 17, 1877, aged seventy-nine years. It has been my privilege to have had a personal acquaintance and correspondence with Mr. Rivers for nearly fifty years. He was one of the most eminent horticulturists of the age. As a nurseryman, pomologist, tree and Rose grower—especially as a hybridiser, in the production and dissemination of new and choice varieties—his name will long be remembered with veneration, gratitude, and respect. For nearly sixty years he was actively engaged in the nursery business, and it can be said with truth that no man in all Europe ever maintained a higher character for fidelity and integrity. As a pomologist he will be remembered for generations to come, especially for the production of new and valuable fruits from seed, which exercised a fascination over him; as he said,

"growing with his growth and strengthening with his decline." As a raiser and introducer of new fruits the Editor of the London *Gardeners' Chronicle* (than which there is no higher authority) said of him, "The name of Thomas Rivers stands pre-eminent. We have had no English pomologist to compare with him in this department, if we except Thomas Andrew Knight."

The same paper gives a list of more than seventy new varieties of fruit raised and sent out by him. Mr. Rivers considered as one of his greatest triumphs the production of early Peaches, by which the season is extended for several weeks, and which are now distributed throughout the fruit-growing world.

As a lover of the Rose, and the great leader in its improvement in England, his name will be embalmed in the hearts of grateful millions, while the Rose shall unfold its petals to the morning light, or shed its fragrance on the passing breeze. Of his love and devotion to the Rose, an author remarks, "Age cannot wither his loyalty, and beneath a hundred medals, orders, and clasps, his brave heart is still with the Rose." His catalogue of Roses, published forty-four years ago, was pronounced by Mr. Loudon "the most useful catalogue of Roses in the English language." Besides writing many excellent practical works on horticulture, Mr. Rivers has been for many years a large contributor to the periodical press, and his various books and papers on the Rose, the Pear, root-pruning, double grafting, the construction of orchard houses and other cheap protections against the uncertainties of an English climate, and other subjects, are among the most valuable contributions to horticultural literature. But, Mr. President, time would fail me were I to enumerate the various ways in which Mr. Rivers' name has been associated with the progress of rural economy and the horticulture of the world. Truly it may be said of him "His works do follow him." His books are the best record of his life.

In view of what I have said, I beg the privilege of presenting the following resolutions:—

Resolved, That in the death of Thomas Rivers, one of the oldest and most respected corresponding members of this society, we recognise, in common with the horticultural world, the loss of a friend of horticultural science, rural improvement, and ornamental culture, and a benefactor of our race.

Resolved, That while we deplore the loss of so useful a man, we desire to thank the Supreme Disposer of all events that he was spared to us for so long a course of years, and was at last gathered to his fathers "like a shock of corn fully ripe in its season."

Resolved, That the members of this society sympathise sincerely with the bereaved family in their affliction.

President Parkman said that his first introduction to a knowledge of the Rose was due to Mr. Rivers's book, in which he recorded his ample experience in the culture of that flower. The book is full of the honest enthusiasm of his character, which here found expression in regard to the Rose. At the time this book was written Mr. Rivers was more prominent in Rose culture than any other Englishman, and, with its progress, he stood equal to any one who has written on the subject. He afterwards wrote on orchard houses, and a passage in the preface to his book on this subject, in which he dedicated the profits resulting from it to the repair of the parish church in which his family had worshipped for generations, showed the quality of the man.

The resolutions were unanimously passed.

Law Notes.

At the Southwark Police Court, before Mr. Partridge, William George Harley, of Guy's Graoaries, Mermaid Court, Borough, appeared to answer a summons under the Seed Adulteration Act, at the instance of Mr. John Charles Ostler, in respect of 1 cwt. of Alsike Clover seed purchased of the defendant.

Mr. Besley appeared for the prosecution; Mr. Washington defended, and Mr. Simpson watched the case on behalf of Messrs. Frith & Maas, who were defendants in a case under the Act heard at this court on the 8th inst.

Opening the case, Mr. BESLEY stated that the admixture of killed seed was formerly a practice not limited to fraudulent persons at all. It was a practice adopted by many under the guise of competition. The fact is, I believe it was a competition which, not being stigmatised as being fraudulent by Act of Parliament, was used for the purpose of getting customers from the unfortunate agriculturists, who would not know of these practices until the season was passed, and their crops affected. Now it is very desirable that this Act should be obeyed, and I am, I believe, correct in saying that all respectable merchants have obeyed the Act of Parliament; and the best proof of it is that it has only recently been

discovered that, as often happens, there are two or three persons exceptionally open to the love of gain, and who do not care about an Act of Parliament prohibiting a thing, so long as they can make gain by their frauds. And in this case we have summoned the defendant that he did, with intent to defraud, sell to the prosecutor, Mr. John Charles Ostler, certain dyed seed, to wit 1 cwt. of Alsike Clover. On the previous occasion, in the case before your colleague, no evidence was called to prove that the seeds were of different kinds, and that the process of "doctoring" was merely for the purpose of passing off as new seed that which was old, merely for "improving" the seed—that was the way the effect was understood by the trade, "improving" the seed—that although in that case it was shown that they were coloured or "dyed" seeds, they were Clover seeds when they were sold, they were Clover seeds when sent to be improved, and after they had been "improved" they were still white Clover seeds. The only change by the sulphur smoke was to give the appearance of new to old seed, and so to improve it. Now I am going to tell you the facts in this case. First of all I may say that it is impossible to a certain extent to give you affirmative evidence what 40 or 50 per cent. of this seed was before it was dyed. Although the colouring matter can be extracted to a certain extent, it cannot be so wholly extracted as to show the nature of that 40 or 50 per cent. of the foreign seeds. I am only using the figures for the purpose of showing the meaning clearly. I can show you with regard to 10 per cent. that that 10 per cent. was seed of another kind dyed so as to resemble Alsike Clover. I shall be able to show you that that 10 per cent. was a mixture of seeds of weeds, and not Alsike Clover. Of course that will be very material in the proof of this case. I think I ought to tell you that Alsike seed is an introduction of modern times. I mean it was discovered and brought from Sweden into this country. It is, of course, one of the numerous grass seeds; and, of course, when you classify seeds you get under the term grass a vast number of different seeds. For instance, Clover is a grass seed, Trefoil is a grass seed, and there are other seeds that are grass seeds producing different qualities of grass, and producing different coloured flowers. Of course this is only as an illustration in passing, you may have Strawberries although producing the same flower they produce very different kinds of fruit, as every one who knows the British Queen, the Devonshire. But with regard to these grass seeds the flower is different. I may tell you that, with regard to this particular Alsike seed, it comes from Sweden, and it is a peculiarity of it that it produces a flower partly red and partly white. White Clover produces only a white flower, red Clover produces only a red flower, but this Alsike Clover produces a flower partially white and partially red. Now, as the flower is different, with regard to the kind I think I should satisfy you that the kind is different. It has been introduced from Sweden because of this quality: that it grows when sown in the Wheat field, and remains longer before flowering, and it does not die away or lose plant because of the winter or the choking effect of other crops; so that you have the farmer giving 10s., and more, per cwt. for it, against 70s. or 80s. for the other kinds. So that, I say, although of the same class, it is the growth of Sweden, it has a different flower, it has different qualities, and in consequence of those qualities it commands a higher price. The price really is accounted for by the different qualities. The qualities it possesses for the purposes of pasturage are certainly more valuable than the qualities of white Clover.

On November 14 the defendant was seen by Mr. Ostler at Law's public-house, and then he was asked about some Alsike, and the defendant said he had 8 cwt., and a sample would be given to Mr. Ostler by his man at Guy's Granaries. Accordingly, Mr. Ostler went and got a sample, which will be produced. On the 16th (Friday) the sample was shown by Mr. Ostler to the defendant, and he said, "Yes, that is the seed. What can you get for it? Can you get 90s.?" Mr. Ostler said he would do what he could. A conversation occurred about sending the sample into the country, and awaiting reply. On the 20th defendant was seen at Law's public-house, and Mr. Ostler said he would take 1 cwt.; he could get it for 84s. In consequence, defendant sold 1 bag at 84s.; took an order to deliver the bag at Trig Wharf, and wrote a receipt in a

pocket-book—"1 cwt. Alsike, 84s., £4 4s., W. G. Harley." Then we come to the sample having been taken subsequently. I think it will be sufficient for me to state to you that between 25 and 40 per cent. appears to be Alsike dyed, but it is still Alsike. There is a larger proportion that we cannot get at, that we cannot ascertain what seed it is, because the colouring matter will not come out; and with respect to the remainder, 10 per cent. was foreign seeds and comprised red Clover, Trefoil, Rib-grass, Timothy, and Thistles, and of course these facts must be proved by persons competent to prove that these seeds thus found were dyed. I shall also prove to you that to the eye of a country seed merchant the dyed seed could not be detected because the colouring matter was the deep green of Alsike Clover seed. If I prove that, I shall submit to you that we are entitled to a conviction against the defendant. In Frith's case no evidence was called to prove that the seeds were of a different kind, but here you see 10 per cent. of these seeds are dyed foreign dyed seeds of a different kind. In that case they were seeds, but still of the same kind; here they are of a different kind.

Mr. Besley then called Mr. JOHN CHARLES OSTLER, who stated that: He lived at Walthamstow and is a commission agent. On Wednesday, November 14, witness saw Mr. Harley, the defendant, at Sam's public house in the High Street, in the Borough. In reply to a question from witness if he had anything to offer, he said a little parcel of Alsike.

Witness continuing: Gave the sample to the solicitor. Is employed by the Society for the purpose of enforcing this Act of Parliament. On Friday, the 16th, saw the defendant in the seed market at Mark Lane and spoke to him about the sample. Told him he could not get that price, 90s., for the sample. He said, Say what you can get. Defendant replied, Very well, I am hard up. I book you 1 cwt. at 84s. Witness felt in his pocket for a piece of paper and wrote on that piece of paper a receiving order addressed to Trig Wharf as an authority to them to receive delivery of the seed from the defendant. (Receiving note produced by Mr. Scott, the manager of Trig Wharf, Chaplin & Horne's). Wrote it on the counter of the public-house. Witness also wrote down a receipt in his pocket-book for the 84s., which defendant signed, witness having paid the 84s. (Pocket-book produced). The entry was, Received in settlement of 1 cwt. Alsike, £4 4s., say 84s. W. G. Harley. On the 22d witness gave a sampling order to Mr. Francis.

Mr. BESLEY: You did not say anything to him about its being doctored?

Witness: I ordered pure seed of him.

Magistrate: The order was for pure seed.

Mr. WASHINGTON: We shall see what the order says.

Mr. BESLEY: On the 22d did you give to Mr. Francis the sampling order?

Witness: I did.

Sampling order was produced by Mr. Scott and identified by the witness.

Witness continued in reply to Mr. Besley: On December 10 a sample was drawn from the bag at Trig Wharf. Witness was present with Mr. Scott. Mr. Scott's man drew the sample, and afterwards brought it to this court. Witness had not touched that sample. It was brought to the court on the occasion of Frith's summons, and witness had not seen it since he handed it over to the solicitor at this court. In reply to Mr. Partridge witness added the sample was about 2 lb.

Cross-examined by Mr. WASHINGTON: Deals in seeds and Hops, and flour. In employ by the Association to look after "doctored" seeds—as inspector. The sample was about 1½ oz. or 2 oz.; might have been 3 oz. It all had the appearance of Alsike. There was Alsike in it; could tell part was not Alsike, because on examination he could detect some Nettle or Thistle. Did not note the extent in the whole sample. Took it to a chemist himself and had it analysed there before buying the 1 cwt. That was to a chemist—Walter, of Walthamstow. Had taken it to him before seeing Mr. Harley again. It did not undergo, to witness's knowledge, any other examination before he saw defendant again. Gave half the sample to Mr. Francis, and it was shown to the Society and then returned to witness. It was returned to witness the same day; kept it in his pocket some time after that until giving it to the solicitor. It went through no other opera-

tions. The part given to the chemist underwent analysis, the other part did not, but witness found by examination some of it was not Alsike. Took it from the granaries. It was not all Clover seed; some of it was Thistle seed, some Trefoil. When witness said he wanted the seed for mixing defendant did not reply that he did not know anything about mixing, but sold it according to sample.

WILLIAM NAPIER SCOTT, examined by Mr. Besley: Received the order now produced for the delivery of the seed at Trig Wharf, of which he is manager, and with it one bag of seed. Could not say the date, but it was as per receiving note. Looking at the office-copy of the housing account, witness said it was November 20. Also received the order produced, called a sampling order, authorising the delivery of a sample to Mr. Francis, and upon that sampling order delivered a sample from the same bag that had been received under the first order.

ALEXANDER FRANCIS, examined by Mr. Besley: On November 22 went to Trig Wharf with Mr. Maclellan with a sampling order from Mr. Ostler. Mr. Scott instructed one of his men to draw the sample, which was handed to witness. On the 23d witness handed the sample to Mr. Bernard Dyer, chemist. Had since seen the samples, both of December 10 and of November 22d, and had examined the one drawn for him, that is November 22 (sample produced by Mr. Dyer). Gave the whole of the sample to Mr. Dyer, about half-a-pound or a pound. Examined the samples in Mr. Dyer's office on two or three occasions, Mr. Dyer being present. There are several dyed seeds of different kinds in the sample.

Mr. FRANCIS, in reply to Mr. Besley, continued: Some portion of the seeds he examined on those two or three occasions in the presence of Mr. Dyer were dyed, not the whole. (This referred to sample of November 22.) The effect of the dyeing is to give them a greenish colour. The normal colour of Alsike is greenish; some of it was rather bluish, but it had not been done very well. Witness found seeds other than Alsike—Trefoil, Rib-grass, Timothy—that had been dyed. Rib-grass was a grass used principally for sheep-feeding. Also found some Thistles. Trefoil seed is of a yellow colour, but in that sample it had been dyed. Rib-grass is of a brown colour; that had been dyed. The natural colour of Timothy is white, and it had been dyed a bluish green. Had had several years' experience with regard to seeds. Alsike was an introduction of comparatively recent date. Its value would be from 100s. to 110s. per cwt., perhaps Rib-grass would not be worth more than 16s. to 20s. at the outside. Low Trefoil would be worth 30s. to 45s., and red Clover 45s. to 70s. per cwt. Did not know the present value of Timothy, but thought about 30s. Was not aware that Thistles possessed any value. Would say there was quite 10 per cent. of foreign seeds other than Alsike in the sample. Had seen Alsike growing many times. The flower is partly red and partly white, and in colour it quite differed from red Clover, which is a bright red, or white Clover, which is quite white.

Witness: Alsike possessed other qualities differing from the ordinary Clover, and giving it a higher value. It is sometimes sown on "Clover-sick" land, where the common Clover would not grow. It is more productive and seeds later than the ordinary white Clover, and also stands longer. And these differences give it its extra value.

Cross-examined by Mr. WASHINGTON: Could see there was about 10 per cent. of foreign seeds. Had seen Rib-grass sold separately on many occasions. Had not known it sown separately. Had known Timothy sold separately and sown separately. Trefoil is quite distinct from Alsike. Botanically one is called Medicago and the other Trifolium. Could not tell the per centage of rib-grass or Timothy separately, nor what proportion of the one-tenth was Clover-seed. Rib-grass and Timothy were not always found with Clover. Had seen samples of Alsike where there were no Thistles whatever, both English and foreign grown samples. Such instances were not rare in samples of good seed. There are a great many samples of white Clover-seed in which there is no Rib-grass found.

Mr. WASHINGTON: And is not Timothy found also with Clover-seed?

Witness: You won't say with what Clover-seed.

Magistrate: Is it your contention that it is impossible to sell it thoroughly pure?

Mr. WASHINGTON: Yes.

Witness: Had never seen Timothy or any other

kind in samples where they have a bluish-green colour; not in genuine Alsike.

Mr. PARTRIDGE: Were they of a bluish-colour?

Witness: Some were, and some were of the proper colour.

In reply to Mr. Washington: Should say one-tenth of the seeds were foreign seeds. Could not exactly say what proportion of that one-tenth were dyed; perhaps one-half. There were other seeds in the sample that witness believed to have been dyed, but there is no chemical means of removing the dye. The dyeing was perceptible to any one who had been dealing in these seeds.

Mr. BERNARD DYER, examined by Mr. Besley: Is an analytical chemist. Received a sample of Alsike Clover on November 23 from Mr. Francis. Witness produced remainder of the sample in a bottle. The sample was marked "1 cwt. Alsike Clover, Harley, 20/11/77." There was about half a pound. On submitting it to analysis witness discovered a considerable quantity of indigo dye present. About 8 or 10 per cent. approximately of the seeds in the sample were so dyed. The effect of indigo is to give to some seeds a bluish colour and to some a greenish colour, so that seeds of a light or brown colour would resemble Alsike. The colour would depend upon the nature of the husk of the seed. The dyeing would make it present the appearance of Alsike, which it would not otherwise have. Witness produced a couple of bottles containing some indigo extracted in two experiments upon this seed. If the seeds had been undyed, the difference of colour would enable an ordinary observer to distinguish them from Alsike at once.

Cross-examined by Mr. Washington: The sample was a sample of low-price Alsike, but could not say it would be a market sample—a sample of ordinary Alsike. Indigo is a vegetable product, but could not be extracted from Alsike. Alsike would not give off indigo. Had tried to produce a blue colour from Alsike, but had been unable to do so. Was unable to extract from pure Alsike any blue colouring matter without entirely destroying the seed. In the sample submitted for analysis there were dyed Thistle, Timothy, and Rib-grass seeds.

Magistrate: How is the dyeing done?

Witness: They are soaked in a solution of indigo.

Magistrate: And how is the killing done?

Witness: I believe the seeds are usually killed by heat.

Magistrate: And the object of that is to prevent it growing, and when the harvest comes to prevent its being known, so that the farmer may think his ground has failed, or that an insect has destroyed it?

Witness: Yes.

SAMUEL BURNELL DICKS, examined by Mr. Besley: Is in the employment of Messrs. Burnell & Co., seed merchants, as manager. Is acquainted with the value of seeds. Alsike is worth from 10s. to 120s. Colouring by indigo is only for the purpose of preventing a practical man from discovering that what he is buying is an impure sample. It does no good to the seed. The value of red Clover ranges from about 50s. to 75s., or for a very fine clean sample a little more. Trefoil at the present time is worth 30s. to 35s. for very fine value. Rib-grass would be worth 20s., and Timothy from 30s. to 32s., and for sowing purposes the Thistles are rather a disadvantage. If foreign seeds coloured with indigo were mixed with Alsike it would be possible, of course, for the dealer to sell a hundredweight much above its intrinsic value, and certainly it would be to the damage of the purchaser.

Mr. BESLEY: I understand it is the dyeing you object to?

Witness: I object to it because it passes off a weed as a fair sample.

This concluded the case for the prosecution, and Mr. Washington addressed the magistrate on behalf of the defendant. In the course of his remarks he said, I will ask you to say upon the evidence that this is not an infringement of the Act of Parliament at all. The Act lays it down very plainly by the interpretation clause what it shall be. The term to dye means to dye by any process of dyeing, sulphur smoking, or other means, to give the seeds the appearance of seeds of another kind. We have the word "kind" laid down in many of our English dictionaries as meaning race or genus. And that is very plain, because even the Latin word we have for kind is genus, which comes from *gignere* to beget; and you show that kind means race, not different descriptions

of one plant but different plants, different races from different stocks. All the component parts of this seed sold to the plaintiff are, with the exception of a very small amount, indeed different kinds of Clover.

Magistrate: Of an inferior quality.

Mr. WASHINGTON: Of an inferior description it may be, I do not at all deny that. For Trefoil is one, and the witness said in answer to my question, a very good kind too, not an inferior kind at all. Then there were some Rib-grass and Timothy which, as the last witness very candidly said, are to be found in all these sales that are made of this kind of Clover. If that is so, we have not infringed the Act of Parliament at all in any way whatever, because you must give that meaning to the word kind which is given in a dictionary. And the intention of this clause is clearly that it was to be so, that you should not give to Clover-seed by dyeing, or sulphur-smoking, the appearance of seed of a different genus or class; that you should not, for instance, give to Rye-grass, by any foreign introduction, the appearance of, say Clover, if it were possible; that you should not thereby defraud; but it does not extend to giving one description of Clover the appearance of another description of the same class or race; that it means race or genus, a different description in every way whatever, and that so long as it is only Clover that is introduced, there is no offence against the Act of Parliament.

Magistrate: Your argument comes to this, that if an agriculturist buys this, the most expensive kind, it is sufficient if the vendor supplies him with an inferior kind.

Mr. WASHINGTON: No, sir. It is not intended to do away with the civil remedy. And it would be present here.

Magistrate: But in addition to the civil remedy, if the other dyes one kind to make it resemble another, or he kills the seed, then the Act applies.

Mr. WASHINGTON: Yes, if we dye it according to the Act. But you must give the interpretation to the word kind, as in the interpretation clause, and that was argued by the prosecution the other day, and decided by your learned colleague that it was kind or race, as in the example which Mr. Besley gave of Strawberries.

Magistrate: It seems to me the farmer is entitled to whatever species of Clover he chooses, and if he does not get the right one, and the vendor does not bring himself under this Act, then the farmer would have a right of action. But if he brings himself under this Act, he has not only a right of action, but is also protected under this Act. He may order whatever kind of seed he likes. If it is adulterated, and he finds the seed, by adulteration, is made to resemble some other kind of seed, then it is an offence under this Act.

Mr. WASHINGTON: I say by ordering one description of Clover seed it is not an offence so long as it is Clover seed.

Magistrate: If your view is right, the Act is nugatory. I do not see a single word in the Act to bear out your view.

Mr. WASHINGTON: I can only point to the usual meaning of the word "kind" held by all dictionaries, and which we have all been taught to know as the meaning of the word "kind."

Magistrate: The Act says "any seeds whatever." Those are words as large as can be.

Mr. WASHINGTON: But all these Acts are guided by the interpretation clause and the whole Act must be governed by that clause.

Magistrate: Well, I consider the farmer entitled to order any species of seed he pleases. You bind him to the genus. I say he can go beyond that and order any species of the genus he pleases. You see in this case, as was said by one of the witnesses, the dyeing has enabled the vendor to palm off a bad seed as genuine seed.

Mr. WASHINGTON: Only Mr. Dicks would not say 80s. or 84s. was a fair price for this.

Magistrate: Competition shows what a price should be, and the offence is not that it is an admixture, but that some of the seeds are dyed, so as to make the inferior seed resemble pure Alsike; but the question is, whether it has been killed or dyed. Here it has been dyed. I think I had better say this case is quite different from the case my colleague decided upon. In that case there was no proof, as required in the Act, that the seed had been dyed to resemble another kind. My colleague in my judgment very properly dismissed that case; but here, according to

my view, the requirements are fulfilled, and it is clearly proved that the defendant sold as pure Alsike an admixture of other and inferior seeds.

Mr. WASHINGTON: I will take that as your ruling for the present. Then comes a very serious question again. What is the meaning of this—"With intent to defraud, or with the intention to enable other persons to defraud"? Now, we have it proved—even taking the whole of the evidence by the plaintiff as borne out by his witnesses—that the part dyed at all would not be beyond one-eighth or one-tenth of the whole lot; therefore, out of 100 seeds only ten at the outside would be dyed, and that the price of very good Alsike is 105s. to 120s., that a person buying this by sample would not give more than what he thought to be the right price, and that 84s. or 90s. would not be an outside price for seeds of this kind. Now, we have it from this very man, who is employed by this Association, that he has the sample in his own care on November 14, that it is not sold to him in any other way than by sample, and I shall ask you to say, as one of the questions in this case that will have to be decided, that a sale by sample does away with the intention to defraud; that where there is a sample, and that sample is in the hands of the purchaser to do as he likes with, and, as he does in this case, six days before he comes again, there is no intention to defraud, that a sale by sample takes it out of the meaning of intention to defraud.

Magistrate: Then your argument is this: if two fraudulent dealers conspire to defraud the public, all they have to do is to buy and sell by sample.

Mr. WASHINGTON: When he gives him the sample there can be no intention to defraud. He has the sample a reasonable time, he has it tested, and yet after that he goes and buys from that sample that has been shown to him six days before. I shall submit that where there is a sale by sample there is no intention to defraud applicable to this Act. And it would be monstrous in a case of this kind, that there should be a conviction upon the evidence that we have heard in this case to-day, when 10 per cent. only is proved to be dyed even by the analyst; when the foreign substances are those which may even, and do come in the natural growth of the seed itself, that they are a common mixture, and sold every day with the seed itself, and there is no proof whatever—not a scintilla of proof—to show that Mr. Harley knew there was a single dyed seed in it—not an atom of proof to show that Mr. Harley knew it was not pure Alsike, and the very conduct of the informer shows that. When asked why he had not told Mr. Harley, he would not swear that he had told him a single word about it. There is not a single atom of proof whatever, or that he had any fraudulent intention whatever.

Magistrate: The defendant is a dealer in seeds, and the smallest possible precaution whatever would have enabled him to detect the presence of the dyed seeds.

Mr. BESLEY: Upon this point, sir, the fifth section says, "or with the intention of enabling any other person to defraud."

Mr. WASHINGTON: But then, sir, they must prove; there must be some proof that he knew he was selling fraudulent seed. Why, the matter would have been very easily tested, to do right. They would have gone to him and asked him if there was any dyed seed in it. But that did not suit; so they have it six days, do as they like with it—I do not know what they have done with it—and then they say we will have some more because we have not a sufficient sample. I say the whole circumstances show the greatest neglect on the part of the prosecution, that the sample does away with the intention to defraud, and that he has not committed an offence within the Act.

Magistrate: I am against you upon that point also, but of course your witness may alter my decision.

Mr. WASHINGTON then called George William Whitworth, who stated: He is a seed merchant at Mark Lane. Has been in the seed trade twenty years. His skill is so well known in the Borough that he can by manipulating tell what kind of seed it is.

Mr. BESLEY: Which has been done.

Witness continuing: Was not present when the sale to Mr. Ostler was made, was only present at the subsequent interview on the 20th, Tuesday, in the public house. Mr. Ostler was very busy. Mr. Harley came in with the seed. There was a question about the price (88s.) Mr. Harley wanted. Ostler

offered 2s. He told Mr. Harley, "If this was settled, if this goes down, George, I shall be able to take the remainder of it." Mr. Harley said "All right." He did not read over his entry to Mr. Harley.

Cross-examined by Mr. BESLEY: Did not mean to represent that he was a subscriber to Mark Lane, or had a stand there. Did not call the sample in question a genuine article. Had sold, and does now, dyed seeds, but had not sold Alsike. Does not profess to sell the dyed or doctored seeds.

Magistrate: This witness's evidence does not alter my view at all. I convict defendant in the penalty of £5 and costs.

Mr. BESLEY: I shall ask you to make a liberal certificate for costs, as he has already had £4 4s. for these seeds. I may ask you to mention the amount of costs you will allow.

Mr. WASHINGTON: I do not think there ought to be any costs in a matter of this kind, in which the defendant has dealt fairly, has sold at a fair price, and therefore I consider—

Magistrate: What is in the interests of the public. I should rather the costs should be as usual. I give 2s. costs—£5 penalty and 2s. costs.

Notice of appeal was given.

The Weather.

Dec. 13.—A fine bright day. Cold. Rain fell in early morning.
 14.—Fine, but cold and gloomy. Hoar-frost at night. Slight fog in morning.
 15.—Fine, but dull and cloudy. Cold day, Hoar-frost in morning.
 16.—A dull, cloudy day. Slight rain at 6.30 P.M. Mild.
 17.—A very dull day. Mild. Clear at night.
 18.—A fine day, partially cloudy. Cold. Thick fog at night.
 19.—A miserably dull day. Cold and raw. Thin rain fell after 6 P.M. Fog.

LONDON: *Barometer.*—During the week ending Saturday, December 15, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.18 inches at the beginning of the week to 29.98 inches by the afternoon of the 10th, increased to 30.11 inches by noon on the 11th, decreased to 29.75 inches by the morning of the 12th, increased to 29.99 inches by the evening of the same day, decreased to 29.90 inches by the afternoon of the 13th, increased to 30.52 inches by the morning of the 15th, and was 30.41 inches at the end of the week. The mean reading for the week at sea level was 30.11 inches, being 0.14 inch above that of the preceding week, and 0.13 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 52° on the 12th to 40° on the 10th; the mean value for the week was 45°. The lowest temperatures of the air observed by night varied from 29° on the 11th to 39° on the 9th; the mean for the week was 33°. The mean daily range of temperature in the week was 12°, the least range in the day being 8° on the 10th, and the greatest 15° on the 15th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—December 9, 44°.8, +3°.6; 10th, 36°.5, -4°.5; 11th, 36°.2, -4°.6; 12th, 45°.3, +4°.6; 13th, 39°.3, -1°.3; 14th, 36°.7, -4°; 15th, 37°.8, -2°.9. The mean temperature of the air for the week was 39°.5, being 1°.3 below the average of sixty years.

The highest readings of a thermometer with black-

ened bulb in vacuo, placed in sun's rays, were 77° on the 9th, 70° on the 13th, and 65° on the 12th; on the 11th the reading did not rise above 44°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 24° on the 10th, 25° on the 11th, and 26° on the 15th; the mean value for the week was 28°.

Wind.—The direction of the wind was S.W., and its strength gentle. The weather during the week was fine but cold, and the sky cloudy. The mornings were generally frosty. Slight fog prevailed on the 14th.

ENGLAND: *Temperature.*—The highest temperatures of the air observed by day varied from 54° at Truro, 53° at Plymouth, and 53° at Liverpool and Leeds; the highest temperature of the air at Brighton, Hull, and Sunderland was 49°; the mean value from all stations was 51°. The lowest temperatures of the air observed by night were 25° at Cambridge, 28° at Bristol, 28° at Wolverhampton, and 29° at both Truro and Nottingham; the lowest temperatures of the air at Leeds was 35°, and at Bradford was 34°; the mean from all stations was 31°. The range of temperature in the week was the greatest at Truro and Cambridge both 25°, and the least at Liverpool, 15°. The mean range from all stations was 20°.

The mean of the seven high day temperatures was the highest at Truro, 51°, and Plymouth, 49°, and the lowest at Norwich, 43°, and Hull, 43°; the mean value from all stations was 45°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 31°, and Cambridge, 32°, and the highest at Liverpool, 38°, and Portsmouth, 38°; the general mean from all stations was 35°. The mean daily range of temperature in the week was the greatest at Truro, 13°, and the least at Sunderland, 6°; the mean daily range from all stations was 10°.

The mean temperature of the air for the week from all stations was 40°, being 3° lower than the value for the corresponding week in 1876. The highest were 44° at Truro, 42° at Portsmouth, Plymouth, and Liverpool; and the lowest, 38°, at both Cambridge and Wolverhampton, and 38° at Hull.

Rain.—The amounts of rain measured at the several places varied from 3/4 of an inch at Liverpool and Eccles to one-tenth of an inch at Leicester, Cambridge, and Wolverhampton. The average fall over the country was four-tenths of an inch.

The weather during the week was fine, but cold, and the sky generally cloudy.

Snow fell at Bradford on the 13th inst., and a lunar halo was seen at Liverpool on the 15th inst.

SCOTLAND: *Temperature.*—The highest temperatures of the air varied from 53° at Leith and Perth, to 48° at Aberdeen; the mean value from all stations was 51°. The lowest temperatures of the air varied from 32° at Dundee, to 35° at Glasgow; the mean from all stations was 33°. The mean range of temperature in the week from all stations was 17°.

The mean temperature of the air for the week from all stations was 41°, being 3/4° lower than the value for the corresponding week in 1876. The highest was 42° at both Glasgow and Leith, and the lowest 40° at Dundee and Aberdeen.

Rain.—Rain fell at Greenock to the amount of 5 1/2 inches, whilst at no other place did the fall exceed 1 1/2 inch, at Edinburgh only half an inch fell. The average fall over the country was 1 1/2 inch.

DUBLIN.—The highest temperature was 54°, the lowest 28°, the range 25°, the mean 42°, and the fall of rain half an inch.

JAMES GLAISHER.

Variorum.

CYCLAMENS.—The display of Cyclamens made this season by Mr. H. B. Smith at the Ealing Dean Nursery exceeds in extent and excellence anything that has preceded it. Something like 14,000 plants can now be seen in various stages of growth, from those now in full bloom to others that will not blossom till April. What strikes us is the evidence on every hand that the very utmost is got out of a plant without loss of vigour, and there is an admirable balance of flowers and foliage. Not less than five houses are filled with these beautiful subjects, but there are frames full to overflowing that will by-and-by furnish a market supply. The most forward plants, numbering several hundreds, are in full bloom, heads of large flowers, fine in shape and charmingly varied in colour, surmount large, vigorous leaves, in many instances handsomely marked. One is more impressed than ever with the fact that the Cyclamen, when well managed is a foremost autumn and winter flowering plant, almost unrivalled for decorative effect. So well are the plants managed throughout, that Ealing Dean may be regarded as the head quarters of Cyclamen culture. Just now, as the production of flowers for the Christmas season is all important, the plants are kept rather close, but sprinkled overhead every morning with a fine rose; a

little heat is applied, and sufficient air to keep the plants from drawing. The pure white varieties are particularly conspicuous, and they are generally associated with finely marked foliage; they are also more vigorous in growth than the deeper coloured types. Mr. Smith has a wonderfully fine strain, selected from the grandiflora section, in which the flowers are of enormous size, the foliage correspondingly bold. There are something like 500 or 600 plants, in 48 and 32-sized pots, just coming into flower. The seedling house is an object of considerable interest just now. It contains 14,500 plants, twelve in a 48-pot, and the fertilising power of the seed is shown by the fact that there is scarcely a failure to be detected. Later on, these plants will all be potted off singly into small 60-pots, and grown on into size to flower next autumn and winter.

Answers to Correspondents.

ASPARAGUS: *T. Kelly.* Under the circumstances we should risk removing the plants. If raised and planted with care they would probably do fairly well if the season is not too continuously wet to rot the roots while dormant.

CHRYSAETHANUM: *H. Cannell.* Your bronzy sport from George Glenny is a very neat and pretty flower, but very much in the way of E. Sanderson, mentioned by us last week.

CUCUMBERS: *H. J. C.* The roots of your Cucumber plants have been attacked by a minute Vibrio, of which an illustration has more than once been given in the *Gardeners' Chronicle*. It will be absolutely necessary to have entirely fresh soil and to lime wash the walls burning the diseased plants. *M. J. B.*

CYCLAMEN: *J. A.* Not common, though we have seen similar instances before, and figured a more perfect specimen in our number for December 16 last year (p. 785).

CAMELIAS: *R. G. S.* The grafting has nothing to do with it. The want of success with foreign-grown plants is no doubt owing to the practice of shifting them too suddenly into soil of a different character.

DEODARS: *D. Belfast.* You may cut them in spring, just before they make fresh growth.

FRUIT STAINS: *A. G. S.* Try chlorinated soda.

GRAPES, IMPERFECT SWELLING OF: *G. W.* Your Grapes appear to show a case of defective stoving.

HOLLY LEAVES DROPPING OFF: *Cor.* We can only suggest that the Hollies have suffered from the vapours of some chemical works.

LICHEN ON FRUIT TREES: *J. F. D.* The presence of Lichens indicates either a damp soil or a close situation, which should be remedied. Then scrape the stems with some blunt instrument, and dust them with wood-ashes when damp.

NAMES OF FRUITS: *J. E. 1.* Small's Admirable; 2, Dutch Mignonette; 5, Lemon Pippin; 4, Golden Noble, others not known.—*L. Bryan.* 1, Scarlet Nonpareil; 2, Formosa Nonpareil; 3, rotten; 4, Baxter's Pearmain.—*J. F. 1.* Dunmow's Seedling; 2, Fearn's Pippin, others not known.

NAMES OF PLANTS: *R. H. V.* The proper name of the plant, known in gardens as *Eucharis candida*, is *Calliphrya subdentata*. It was figured and described in the *Botanical Magazine* for April last, tab. 6289. We believe it flowers freely at the Pine-apple Nursery, and will ask Mr. O'Brien to tell us how he manages it.—*Philomathes.* 1, *Calanthe vestita*; 2, *Maxillaria picta*; 3, *Zygopetalum crinitum*; 4, *Begonia Dregei*; 5, *B. Saundersii*; 6, *B. incarnata*; 7, *Pentas carnea*.—*Wood & Ingram.* *Phacelia Menziesii*.—*Dublin Subscriber.* *A. Casuarina*, but impossible to say which species.—*F. Jones.* We cannot name plants from leaves only.

OAK: *C. B. S.* The leaves appear to be those of the Fulham Oak, but they are very large. We will compare them and let you know the result.

PARAFFIN: *G. W.* We have never tried it on the leaves of stove plants, nor should we care to do so while there are plenty of insecticides that we know to be safe. It is impossible for us to say to what extent paraffin should be diluted to render it safe, and at the same time efficacious, because it is not always sold of the same strength.

PRIMULAS: *W. Heath & Son.* Three solitary flowers are not enough to enable us to say anything in favour of a strain of Primulas. What we have received may be included amongst the good ones.

VINES: *C. D.* Prune now at any time, keeping the house cool afterwards till you require to start forcing.

WELLINGTONIA: *T. S. P.* *Sequoia gigantea* is the proper name of the tree, popularly called Wellingtonia. The Red-Cedar still retains the name of *Taxodium sempervirens*.

WINTER FLOWERS: *C. D.* Consult the articles on winter flowers published by us last week. You might also have *Pelargoniums*, *Centropogons*, *Justicias*, *Libonias*; and by a little forcing *Astilbe* (*Spiraea japonica*), *Roman Hyacinths*, *Eucharis*, *Lily of the Valley*, &c.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, December 20.

This being Christmas week, our market naturally wears a more lively aspect, but business is not what it ought to be, buyers holding aloof till Saturday's market. The supply of vegetables has been above the average, and prices have ruled low. Amongst Apples the commoner sorts have been in excess of the demand, while first-rate varieties, though making only average prices, have been short. Pears have been mainly supplied from the Continent, prices averaging higher than for several years past, but owing to the forward season, they are nearly over. A very short supply of Cobs lately has temporarily enhanced their value. James Webber, Wholesale Apple Market.

FRUIT.

Table with columns for fruit types (Apples, Grapes, Lemons, Nuts, Cobs, Oranges, Pears, Pine-apples) and prices in s. d. s. d.

VEGETABLES.

Table with columns for vegetable types (Ariehokes, Asparagus, Beans, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Potatoes) and prices in s. d. s. d.

CUT FLOWERS.

Table with columns for flower types (Abutilon, Arum Lily, Azalea, Bouvardias, Camellia bims, Carnations, Christmas Roses, Chrysanth, Epiphyllum, Eucharis, Euphorbia jacquiniifolia, Gardenia, Heliotropes, Hyacinths, Rom) and prices in s. d. s. d.

PLANTS IN POTS.

Table with columns for plant types (Azalea, Bouvardias, Camellia, Chrysanth, Clematis, Coleus, Cyclamen, Cyperus, Dracena terminalis, Erica Hyemalis, Ficus elastica) and prices in s. d. s. d.

*. The demand for flowers being much increased for Christmas decorations, &c., the above prices must only be taken as a guide, and must not be fully relied on.

SEEDS.

WEDNESDAY: Dec. 19.—The close of the year being so near at hand, the seed market has assumed its usual holiday appearance, and the actual business doing has shrunk into very narrow proportions. Notwithstanding, however, this present inactivity, which will probably continue for two or three weeks longer, there is a firm healthy feeling in the trade, values for all descriptions being well maintained. French Cloverseed continues in abundant supply, and the quality this year is satisfactory. In America, the cable reports red seed to be £1 per ton cheaper; but, even at this concession, there is no temptation to English buyers to import from that country. In fact, before the United States can obtain an European outlet for their surplus stock, either prices in France must advance, or prices in America decline. Taking quality into account, Western seed does not compete with French by some 2s. to 3s. per cwt. As regards English red Clover and Cow-grass, a few more samples are now appearing on Mark Lane, but the transactions have as yet been too small to definitely

establish values. White Clovers keep very steady; but in Alsike, the tendency favours the buyer. In spite of the neglect with which Trefoil has for some time been treated, quotations exhibit continued strength, owing, no doubt, to the great scarcity here of the article, and also to the absence of the usual Continental offers. Good black Rape seed is 1s. to 2s. per qr. dearer; but, in Mustard, there is no alteration. Canary seed finds occasional buyers at full rates, but dealings are naturally contracted by the approach of Christmas. For feeding Linseed the trade is inactive, the supply having lately been in excess of the demand. There is a quiet sale for blue Peas at last Monday's figures. Haricot Beans are now obtainable on very moderate terms. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade at Mark Lane on Monday was very quiet. There was no appreciable change in prices; but the tone as regards Wheat was distinctly easier, and, though holders were not anxious to force sales, it was necessary to make some concession to conclude business. Barley was cheaper to sell; and in the value of Oats a slight reduction was reported for the week. Malt was dull, but without quotable change. Maize, too, supported previous figures; while Beans and Peas were without alteration. Flour was heavy, without being decidedly cheaper.—Wednesday's market was very dull, but with Christmas close at hand any activity in the market is not expected. Holders, as before, were not over anxious sellers, and, though prices were in favour of buyers, no actual change was reported from Monday.—Average prices of corn for the week ending December 15:—Wheat, 51s. 7d.; Barley, 44s.; Oats, 24s. For the corresponding week last year:—Wheat, 50s. 4d.; Barley, 38s. 10d.; Oats, 25s. 4d.

CATTLE.

The annual market for the sale of fat stock for Christmas was held at Copenhagen Fields on Monday. Taken altogether the show must be classed as a fair success. The number of beasts was in excess of last year, and there was a greater proportion of choice breeds. At the same time second-rate animals were far from scarce. The chief point of interest was the large supply from Scotland, about 2300 head having been received. This was a marked increase over last year, whilst the quality and condition were fully as good. In fact, seldom has such a fine display of choice kinds been seen. Cross-bred stock was well represented, and there was also a good show of Herefords and Devons. Ireland contributed a good supply, and it was satisfactory to observe that there was some amelioration in their condition. There was a very thin representation of foreign stock. It may here be noted that there were shown in 1847, of beasts, 4282, selling at prices ranging between 3s. 4d. and 4s. 8d.; in 1857 there were 6356, at the same figures; in 1867 there were shown 8110, selling at from 3s. 4d. to 5s.; and this year the number on show was 7510, those sold fetching from 4s. 6d. to 6s.—last year's prices being 4s. 4d. to 6s. 4d. per 8 lb. As regards sheep the supply fell considerably short of last year. There were some fine specimens exhibited, including an occasional prize taker from the Agricultural Hall. The general appearance of the stock in some measure compensated for the shortness of the supply—the numbers being, home, 11,960; foreign, 200. Prices ranged between 5s. 6d. and 6s. for coarse and inferior, and 6s. 8d. to 7s. for prime sorts. Calves and pigs were quiet, the former at from 5s. to 6s. 6d., the latter at from 3s. 6d. to 4s. 6d.—The cattle trade on Thursday was decidedly dull. Beasts were in excess of the average for a Thursday, most butchers being already supplied. The demand ruled heavy, and quotations were lower than on Monday. Sheep were not plentiful, but they sold slowly at drooping prices. Calves and pigs were quiet.

HAY.

From Tuesday's Whitechapel report we learn that there was a good trade for fodder, with a rather large supply. The quotations were:—Prime Clover, 100s. to 138s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 105s.; inferior, 70s. to 85s.; and straw, 44s. to 55s. per load.—Cumberland Market quotations:—Superior meadow hay, 100s. to 112s.; inferior, 80s. to 90s.; Superior Clover, 126s. to 135s.; inferior, 95s. to 110s.; and straw, 54s. to 60s. per load.

POTATOS.

From the Borough and Spitalfields markets reports we glean that the arrivals continue upon a moderate scale, and trade remains quiet. Quotations are as follows:—Kent Regents, 150s. to 165s.; Essex ditto, 140s. to 155s.; rocks, 100s. to 120s.; kidneys, 120s. to 140s.; flukes, 160s. to 180s.; Victorias, 150s. to 180s. per ton.—The Potatos received at the port of London during the past week comprised 39,659 bags from Hamburg, 12,910 Stettin, 3129 Ghent, 2854 Antwerp, 1410 Rotterdam, 1123 Boulogne, 1434 Dunkirk, 164 tons Dantzic, 214 sacks Caen, 99 tons Rouen, and 93 Groningen.

COALS.

The prices current at market on Monday were as follows:—Beside West Hartley, 16s. 3d.; Walls End—Hetton, 18s. 6d.; Hetton Lyons, 16s. 3d.; Hawthorn, 16s. 3d.; Lambton, 18s.; Original Hartlepool, 18s. 6d.; South Hetton, 18s. 6d.; East Hartlepool, 18s. 3d.; Tees, 18s. 6d. Wednesday's transactions were at the following figures:—Springwell Hartley, 16s. 3d.; Walls End—Hetton, 18s. 6d.; Hetton Lyons, 16s. 3d.; Lambton, 18s.; Original Hartlepool, 18s. 6d.; Tunstall, 16s. 3d.; Vanes, 16s. 3d.; Hartlepool, 17s. 6d.; East Hartlepool, 18s. 3d.; Tees, 18s. 3d.

Royal Norfolk Seed Establishment.

READY JANUARY 1,

ILLUSTRATED GUIDE

FOR AMATEUR GARDENERS,

Spring, 1878.

Containing 116 pages of beautifully illustrated Letterpress, complete Directions for the successful Management of the Kitchen Garden and Flower Garden throughout the year, with Original Articles on the Cultivation of various Flowers and Vegetables, a Select List of Choice Kitchen Garden and Flower Seeds, Lilies, Gladioli, Seed Potatos, &c. Also a superbly finished Coloured Plate, the whole enclosed in a charmingly beautiful Cover of a new and elegant design.

This will be found by far the most splendid and useful Seed Catalogue ever published, and should be read by every one having a Garden.

Price 1s., post-free. Gratis to Customers.

OPINIONS FROM THE PRESS.

"For a long time Messrs. Daniels Brothers have been noted for their exquisite taste in design and colour manifested by their Catalogues, and we have to say of their Illustrated Guide for Amateur Gardeners for the present spring, that it is quite up to the high standard which this firm aims at." The Farmer.

"This is the most tasteful and best executed thing of the kind we ever remember having seen." The Country.

"Profusely illustrated, and the coloured plates are quite beyond the average of book illustrations." Liverpool Mercury

DANIELS BROTHERS, THE QUEEN'S SEEDSMEN, NORWICH.

LARGE EVERGREEN and DECIDUOUS TREES, for immediate effect:—
ACACIA, White Flowered, 9 to 10 feet high, 24s. per dozen.
ASH, Mountain, Scarlet Berried, 8 to 9 feet, 12s. per dozen; 10 to 12 feet, 18s. per dozen.
BIRCH, Silver Barked, 8 to 10 feet, 18s. per dozen.
SYCAMORES, Common, 10 to 12 feet, 18s. per dozen.
CHESTNUT, Spanish, 8 to 10 feet, 18s. per dozen; 10 to 12 feet, 24s. per dozen.
 „ Horse, 8 to 10 feet, 12s. per dozen; 10 to 12 feet, 24s. per dozen.

Dried and carefully packed for shipment to any part of the world.
 All Orders will be executed in rotation.

MR. CHAS. AYRES,
 CAPE TOWN NURSERIES,
 Wandel Street, Cape Town, South Africa.

SURPLUS NURSERY STOCK, AT GREATLY REDUCED PRICES.

WOOD & INGRAM

Have just issued an abridged LIST of SURPLUS NURSERY STOCK, which will be forwarded free on application.

The Nurseries, Huntingdon, Brampton, AND ST. NEOTS.

Beautiful Flowers and Luscious Fruit.
WILLS' ELIXIR.—This Manure produces the most marvellous and enduring effects on all kinds of Fruits grown under glass, such as Vines, Peaches, Strawberries, Melons, Cucumbers, and all kinds of Flowering and Foliage Plants. It is equally effective when applied to Fruits and Flowers growing in the open air. It is very light, 1 cwt. being equal to 6 cwt. of any other manure; it is also free from all objectionable smells.

“Judging by the results seen in the growth of Vines and Strawberries in pots at HECKFIELD, the BUFFALO-HORN MANURE must possess most valuable manurial properties. The Strawberry Plants being limited in root-space, perhaps offer the most forcible illustration of its value, as these in small 24's are most exceptionally robust, the crowns large, and the foliage of a deep green hue. A moderate portion of the Manure mixed with the soil proves to be a singularly valuable constituent.”—Vide GARDENERS' CHRONICLE, December 8, 1877.

“Royal Horticultural Gardens, Chiswick, August 14, 1877.”
 “DEAR SIR,—No manure that we have ever used here has produced results so decided—so apparent and satisfactory. I therefore consider the Elixir to be the most efficient of manures, and intend to use it largely.—I am, dear Sir, yours very truly,
 “MR. J. WILLS. “A. F. BARKON.”
 Numerous other testimonials may be had on application.
 Sold in Bags at 1s. 6d., 2s. 6d., 5s., and 10s. 6d. each; or by the cwt., £2 4s.
JOHN WILLS, Royal Exotic Nursery, Onslow Crescent, South Kensington, London, S.W.

Sole English Medallists for the Best Hot-Water Apparatus at the United States International Centennial Exhibition, Philadelphia.

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

“The 'Boiler of the Future.' I have no doubt about this.”—WM. THOMSON, Clovenfords.

By Her Majesty's Royal Letters Patent

We can supply Foundation Plates—which form Ash-pit—and Smokestacks, if wanted, thereby doing away with the necessity for even a single brick in their erection.

	A	B	C	D	E
Foundation Plate	s. d.	s. d.	s. d.	s. d.	s. d.
Smokestack, Damper, and Soot-Door	35 0	45 0	60 0	75 0	90 0
Furnace and Ash-Pit, Frame and Doors; also Furnace Bars, Bearers, Dumb-Plate, &c.	30 0	40 0	50 0	60 0	70 0

Foundation Plates are arranged to heat the air before it is sent into the ash-pit at back, and furnace-doors to heat the air before its admission into the furnace, furnishing in fact two “hot-air” blasts to the furnace; the admission of large volumes of cold air being most injurious to the economical working of the furnace.

In preparation an entirely NEW SERIES of SEVENTY BOILERS, embracing a large variety suitable for small places, &c., and all specially adapted for low situations where shallow boilers are a necessity. Particulars on application.

WM. WRIGHT & CO., AIRDRIE, N.B.

Fibrous Peat for Orchids, &c.

HOLDER AND SON, Crown Nurseries, Reading.

ODAMS' MANURES, FOR ALL CROPS.

Manufactured by the NITRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 acres of Land. **Chairman**—ROBERT LEEDS, Keswick Old Hall, Norwich. **Managing Director**—JAMES ODAMS. **Sub-Manager and Secretary**—C. F. MACADAM. **Chief Office**—109, Fenchurch Street, London, E.C. **WESTERN COUNTIES BRANCH**—Queen Street, Exeter. Particulars will be forwarded on application to the Secretary, Or may be had of the Local Agents.

AMIES' CHEMICAL MANURE.

USED BY THE ROYAL HORTICULTURAL AND BOTANIC SOCIETIES.

This Manure, after six years' trial, is unapproached in its results by any other manure. It is suitable for all soils, and permanently improves the fertility of even the poorest. It provides the necessary foods for plants, creates a vigorous growth without over-stimulating, and it increases the produce. It is a powerful insecticide. It has been used with perfect success on

FLOWERS, SHRUBS, VEGETABLES, FRUITS, GRASS, VINES.

PREPARED IN A FINE, DRY, INODOUROUS POWDER. **Price, £12 per Ton; 15s. per Cwt.; and in Canisters, 1s., 2s. and 4s. each.**
 Trial Orders of the Manure are invited, to be used in comparison with other Manures.

Write for Further Particulars to **AMIES' CHEMICAL MANURE CO. (LIMITED), 79, MARK LANE, LONDON, E.C.**

SIMPSON'S RED SPIDER, THIRPS, &c., ANTIDOTE. Testimonials of the highest order on application. Per quart, condensed, 6s.; per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended in the *Gardener*, and by many first-class Gardeners. Prepared by **JOHN KILNER**, Wortley, near Sheffield.

GISHURST COMPOUND.—
 Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Bright, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 1s., 3s., and 10s. 6d. Wholesale by **PRICE'S PATENT CANDLE COMPANY (LIMITED).**

GEORGE'S PATENT CALORIGEN,

FOR **Warming and Ventilating Small Conservatories.**

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory.
 Made in Wrought Iron, £3 3s.
 Made in Copper, £5.
 Height, 28 inches; diameter, 14 inches.
 It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).

Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C.
 This Stove introduces a strong current of warmed (not burnt) fresh air.

CRITCHLEY'S PATENT HEAT REGULATOR, AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot Water. E, F, Pipes for Return of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.
 The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler. The following Testimonial has been received:—

"Berkeley Castle, April 13, 1875.
 "Gentlemen,—I am happy to inform you, now that the late severe winter is past, that the Hot Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes.
 "I am, Gentlemen, yours truly, "R. H. CRONK,
 "Gardener to the Right Hon. Lord Fitzhardinge."
 Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.

"Royal Exotic Nursery, King's Road,

"Messrs. SILVESTER, Chelsea, S.W.—Aug. 8, 1877.

"GENTLEMEN.—In reply to your enquiry as to our opinion of your Stevens' Trentham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Trentham Boiler, and we have now thirteen of various sizes at work.

"For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Trentham Boilers supplied by you, and we have never felt so little anxiety in connection with our hot-houses during the cold winter months as we do now.

"We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.

"We are, Gentlemen, yours faithfully,
"JAMES VEITCH AND SONS."For Illustrations, with full particulars, apply to the Sole Makers,
F. & J. SILVESTER,HOT-WATER ENGINEERS, &c., &c.,
Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the only ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

GARDENER (HEAD, WORKING).—Age 40, married, no family; thoroughly competent in all its branches. Can be highly recommended.—T. W., Bower Terrace Cottage, Tunbridge Road, Maidstone.

GARDENER (HEAD, WORKING).—Age 33, married; thoroughly practical in all branches of the profession. Good character from present and previous employers.—GARDENER, Northfleet House, Northfleet, Kent.

GARDENER (HEAD, WORKING).—Practical; understands the profession in all its departments, order, neatness, and cleanliness, both Indoors and Out, being considered by him essential to good Gardening. Active, healthy, intelligent, and in the prime of life. Any Lady or Gentleman requiring such will please to communicate with J. Z., 145, Vine Street, Liverpool.

GARDENER (SECOND, where three or more are kept, or SINGLE-HANDED not objected to).—Ten years' practical experience in good places. Can be highly recommended.—J. B., 3, Glebe Cleft Villas, Chester Road, Sunderland.

GARDENER (UNDER).—Age 21; seven years in good places, experienced in the various departments. Can be well recommended from last and previous places.—J. S., Somerleyton, Lowestoft.

GARDENER (UNDER).—Age 19. Good references.—T. C., Cuxwold Hall, Caistor, Lincolnshire.

GARDENER (UNDER), in a Nobleman's or Gentleman's Garden, in the Houses.—Age 21; seven years' experience. Four years in present situation. Can be well recommended.—JOSEPH WHITEHEAD, Coombe Bank Gardens, Sevenoaks.

JOURNEYMAN (Good), in a large establishment, in the Houses preferred.—Age 22; good reference.—R. ALLEN, The Gardens, Warsborough Hall, Barnsley, Yorkshire.

FOREMAN, in a Gentleman's Garden.—Age 27; twelve years' experience in all branches of the profession. Good character.—A. B., Mr. Miller's, Carlton Colville, Lowestoft, Suffolk.

FOREMAN.—Ten years' practical experience. Well up in Hard and Soft-wooded Plants. Good knowledge of general gardening. Can be highly recommended.—F. L. Waverley, Farnham, Surrey.

MANAGER, or GENERAL FOREMAN in a first-class Business.—Age 37; twenty-one years' experience. First-class references.—N., 1, Nelson Grove, Merton, S.W.

MANAGER.—A Gentleman, of good address and some years' experience, is seeking an engagement as MANAGER in a First-class Floral Decorative Business, or could take the oversight of general Landscape Gardening and Jobbing Work. Highest references.—G. H., *Gardeners' Chronicle* Office, W.C.

APPRENTICE, under a good practical Gardener.—Age 13. A Premium will be given.—J. B., 7, Cornwall Mews, South Kensington, S.W.

IMPROVERS.—Wanted to place two Youths, age 16 and 17, under a good Gardener; have been three years in these gardens.—THOMAS LAMBIRT, Burton Constable, Hull.

AGENT in LONDON (Agri-Horticultural).—The Advertiser, who has had many years' experience among the leading English and Continental Houses connected with the above, and who has during the past seven years transacted the London Business of a well-known Provincial firm retiring at Christmas next, is open to arrange with another House of good standing in a similar capacity, either at his present office, situate in the very centre of the City, or elsewhere, or would accept Resident Country Agency of House or Landed Property, and give accurate returns of all receipts and disbursements pertaining thereto. Unexceptionable references given and required.—CURATOR, *Gardeners' Chronicle* Office, W.C.

SHOPMAN, CLERK, or TRAVELLER.—Seventeen years' experience in London and Provinces; thoroughly versed in both Nursery and Seed Trade.—G. M., The Orchard, South Park, Reigate.

SHOPMAN (ASSISTANT).—Age 22; has had six years' experience in good Retail Houses. Good references.—J. E., Messrs. Hurst & Son, 6, Leadenhall Street, E.C.

TO SEEDSMEN, &c.—A young Man, with seventeen years' experience, desires a situation; has served as Warehouseman, Shopman, Traveller, and Rye-grass Buyer, for best houses in the Wholesale and Retail Trade. Moderate salary expected. Is a Teetotaler.—G. M., 4, Duncairn Terrace, Belfast.

GRATEFUL—COMFORTING.

JAMES EPPS & CO.,
HOMEOPATHIC CHEMISTS.

KINAHAN'S LL WHISKY.
The cream of old Irish Whiskies. Pure, mild, mellow, delicious, and most wholesome. Universally recommended by the Medical Profession. Dr. Hassall says, "The Whisky is soft mellow and pure, well matured, and of very excellent quality."—20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOITRE, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.
DINNEFORD AND CO.,
172, New Bond Street, London, and all Chemists.

ALL who COUGH, SING, or have COLDS, should read the following from S. Pearsall, Esq., Vicar (Choral, Lichfield Cathedral).—"I am suffering much from this unhealthy season. Send me a few boxes of DR. LOCK'S PULMONIC WAFERS, as they alone afford me relief." They taste pleasantly. Sold at 1s. 1/2d. and 2s. 3d. per box by all Chemists.

HOLLOWAY'S PILLS.—The slightest indisposition, to prevent its rapidly running from bad to worse, demands immediate attention from the afflicted of all classes. A few doses of these thoroughly purifying and strengthening Pills will always be beneficial when the least disorder reigns, or when nervous fears oppress. Two or three Pills at bed-time have the happiest effect in promoting perfect digestion, whereby the muscles are rendered more vigorous, the spirits more buoyant, and the entire frame more hardy. Holloway's medicine increases the quantity of nutriment derivable from a given quantity of food, whereby the quality of the blood is improved, the tone of every fibre throughout the body is heightened, and the disposition to fall into disease is reduced to a minimum.

Her Majesty the Queen.

Seedsman to

H.R.H. the Prince of Wales.

SUTTON'S

NEW OR IMPROVED VARIETIES OF

VEGETABLES, FLOWERS & POTATOS

THE LATEST BROCCOLI.

SUTTON'S LATE QUEEN BROCCOLI.

From THE GARDEN, May 16.—"Late Queen Broccoli is a cream-coloured kind just now in perfection, the head's of which measure 27 inches in circumference. It is the latest Broccoli in Messrs. Sutton's trial grounds, and owing to the size of the heads, their closeness, and fine form, it promises to be a great acquisition to late Broccoli."

Price 1s. 6d. and 2s. 6d. per packet

A new and distinct Green-fleshed Melon.

SUTTON'S WHITEKNIGHTS FAVOURITE

Price 2s. 6d. per packet.

THE BEST FLAVOURED PEA

From Mr. WILLIAM PATTERSON, Gardener to Her Majesty the Queen, Balmoral.
"Your Duchess of Edinburgh is a most splendid Pea, both as a cropper and for cooking."

SUTTON'S DUCHESS of EDINBURGH.

Price 2s. 6d. per quart.

THE BEST CAULIFLOWER.

SUTTON'S KING of the CAULIFLOWERS.

From Major DICKINS, Coldstream.—"Your King of the Cauliflowers is the best I ever saw. Plants grown from the seed I got from you last year took several prizes."

Price 1s. 6d and 2s. 6d. per packet.

THE FINEST LETTUCE.

SUTTON'S SUPERB WHITE COS.

From Mr. R. W. TOWN, Gardener to His Grace the Duke of Buckingham.—"Your Superb White Cos Lettuce is the best kind I know for summer use. No garden should be without it."

Price 1s. per packet, 2s. 6d. per ounce.

THE BEST POTATO.

SUTTON'S MAGNUM BONUM.

SUTTON'S MAGNUM BONUM POTATO.

This Potato was introduced by us two years since, and now undoubtedly ranks as the best and most useful variety in cultivation. It combines great productiveness with excellent flavour, while its power of resisting disease and late keeping properties render it invaluable both for gentlemen's and cottager's gardens, as well as for field culture. The tubers are of uniform size of true kidney shape, with few and very small eyes, almost level with the surface; the skin is russeted, and flesh firm. The haulm is dark green in colour and very robust in growth, which enables it to withstand the disease better than any Potato with which we are acquainted. It may be cooked directly it is taken from the ground, or may be kept till other varieties are useless.

MR. CHARLES PENNY, Head Gardener to H.R.H. the Prince of Wales, says:—

"I find Magnum Bonum the best Potato I ever ate. In flavour it is superior to any variety known."

Lowest price per sack or ton on application.

Sutton's New Cyclamen, "Giganteum Roseum."

This magnificent variety surpasses all others yet introduced. Anticipating a great demand we advise early orders.

Price 5s. per packet

Will be ready in a few days, price 1s., post-free for fifteen stamps, or gratis to Customers.

MESSRS. CHARLES LEE AND SON, Royal Vineyard Nursery, Hammersmith, London, W., have much pleasure in offering the following very beautiful and interesting NEW FRUITS, now offered by them for the first time:—

RUSSIAN TRANSPARENT APPLE.—In the Journal of Horticulture, December 21, 1876, "J. Lincolnshire" describes this valuable Apple as giving a "never-failing crop," and as being "a rent-paying tree" for cottage gardens. Mr. DEULAH, an experienced Lincolnshire Orchardist, confirmed this evidence of the usefulness and profitability of this much neglected but desirable Apple. A tree that bears a never-failing crop, of excellent quality, as stated below by Dr. Hogg, must be as near perfection as possible, and a desideratum that cannot fail to be appreciated by Orchardists in general. The Russian Transparent Apple was brought from Moscow during Napoleon's campaign in Russia, by General Boucheret, who, noticing its hardiness and free growth, and believing it would be suitable for English gardens, brought a quantity of grafts to his home in North Lincolnshire, round which it became and kindness of Mr. Deulah have been enabled to purchase all the available grafts from the original stock.

The following is from Dr. HOGG'S description:—"Fruit large, roundish, somewhat oblate, narrowing towards the crown, where it terminates in several prominent ridges, flat at base; skin smooth and shining, grass green, streaked with large russet dots. Eye closed. Flesh very tender and juicy, with a pleasant sub-acid flavour, and a peculiar and agreeable aroma. I am convinced that this is one of the most valuable culinary Apples in cultivation, and is worth of more than local fame."

Messrs. Charles Lee & Son have much confidence in introducing this desirable and profitable Apple to more extended cultivation. Strong Maiden Plants now ready, price 7s. 6d. each.

HENSON'S SEEDLING GOOSEBERRY.—This excellent variety was figured in the Florist and Pomologist for May, 1874, a First-class Certificate having been awarded to it by the Fruit Committee of the Royal Horticultural Society in 1873. It was described as "a new and distinct variety of exceedingly good quality, of the hairy red section, and a good dessert fruit of medium size."

Messrs. Charles Lee & Son having purchased the entire stock of this valuable Gooseberry, they are now prepared to distribute it to the Public. Price per Plant, 3s. 6d. The usual discount to the Trade.

SPRING FLOWERING PLANTS.

ANEMONE PULGENS, strong plants, established in pots, 1s. each, 10s. per dozen, 75s. per 100. This is the most dazzling scarlet, and of the most valuable culinary Apples in January and continues until May. Most invaluable for the spring garden, and also for cutting, as it opens its flowers just as well under artificial as real light.

CARDAMINE PRATENSIS, fl. pl., Double Lilac, flowers most profuse, first-rate spring flower, 25s. per 100.

PRIMROSE, Double Crimson (true), 18s. per dozen, 140s. per 100.

" Double Crimson Purple, fine variety, often throwing up its flowers in scapes, and continuing long in bloom, 6s. per dozen, 45s. per 100.

" Double Yellow, 4s. per dozen, 25s. per 100.

" Double Lilac, 3s. per dozen, 16s. per 100.

" Double White, 3s. per dozen, 20s. per 100.

" Single Yellow, flowering in scapes, most continuous, 6s. per dozen, 40s. per 100.

POLYANTHUS, strong fine strain, 3s. per dozen, 12s. 6d. per 100.

PHLOX, verm., 4s. per dozen, 20s. per 100.

scab., 4s. per dozen, 20s. per 100.

WALLFLOWERS, Single, Harbinger, Tom Thumb, yellow and early dark brown, 1s. 6d. per dozen, 8s. per 100.

" Double Germans, eight distinct colours, separate, very strong, 1s. 6d. per dozen, 8s. per dozen.

" Double, Golden Drop (pots), 3s. 6d. per doz., 25s. per 100.

" Double, black and striped (pots), 4s. per dozen.

DAISY, Double Crown, very large, 3s. 6d. per 100.

" Snowball, fine, 3s. 6d. per 100.

" Crimson, 5s. per 100.

" Aucubifolia, 10s. per 100.

" Small White French and Carmine French, two very pretty sorts, 7s. 6d. per 100.

" Cærulea (Blue Daisy), 4s. per dozen.

IRIS, pumila, 3s. per dozen.

MYOSOTIS, rupicola (pots), grows 3 inches high, a gem, 6s. per dozen.

RODGER, McCLELLAND AND CO., Nurserymen, &c., Newry.

To the Trade.

AGRICULTURAL and GARDEN SEED.

H. AND F. SHARPE'S WHOLESALE SPECIAL CATALOGUE of HOME-GROWN SEEDS is now ready, and will be forwarded on application. Every variety named in it is of the very finest quality in every respect. The prices are very low. Seed Growing Establishment, Wisbech.

HYDRANGEA PANICULATA GRANDIFLORA.—We can offer extra strong, bushy plants of this really fine, hardy shrub, 2 to 3 feet high, at 13s. and 24s. per dozen. It should be known that this is quite deciduous, and (unlike the commonly known Hydrangeas, which only bloom on the tops of the ripened shoots of the preceding year), flowers on the young shoots of the current one, and so is sure to flower where the others do not. RODGER, McCLELLAND AND CO., Nurserymen, Newry.

New and Choice Potato Offered by S M I T H AND S O N,

Aberdeen. GRANPIAN (Robertson).—A very handsome and singularly distinct early round variety, raised by Mr. Robertson, Sunnyside, Blairs, Aberdeenshire. The tubers are large and flattish, having very shallow eyes, skin pinkish white, flaked with rich rose pink round the eyes; flesh pure white, very dry, and floury when boiled, and of excellent quality. It is very early and a most abundant cropper, remarkable for its hardy constitution and vigorous growth, growing well in any soil. Granpian was to be seen in every prize collection of any importance at the leading competitions of the last two seasons. Price upon application. Sole Wholesale Agents, NUTTING AND SONS, Seed Merchants, 60, Barbican, London, E.C.

Bulbs, Orchids, &c.

THE NEW PLANT and BULB COMPANY beg to call attention to their new CATALOGUE of BULBOUS PLANTS, ORCHIDS, &c., in which will be found many Novelties of sterling merit, including a new White Hardy CYPRIPedium, &c. CATALOGUES post free on application, Lion Walk, Colchester.

CHARLES SHARPE AND CO.'S Wholesale Priced LIST for 1878 is now ready, and will be forwarded, post free, on application.

Seed Growers and Merchants, Sleaford,

SPECIAL OFFER.

APPLES, Standards, fine, 65s. per 100.

PEARS, Standards, fine, 70s. per 100.

" Pyramids, fine, 12s. to 15s. per dozen.

APRICOTS, Dwarf-trained, fine, 20s. to 25s. per dozen.

APPLES, Dwarf-trained, fine, 18s. to 22s. per doz. (doz.)

CHERRIES, Dwarf-trained Morello, very fine, 24s. per dozen.

PEARS, Dwarf-trained, fine, 20s. to 25s. per dozen.

W. BALL AND CO., The Nurseries, Bedford Road, Northampton.

To the Trade.

VINES, VINES, VINES.—Strong Fruiting Canes of Black Hamburgh, Mrs. Pince, Foster's Seedling, Gnes Colman, and Lady Downes, 5s. 6d. each. Strong Fruiting Canes of Black Hamburgh, Foster's Seedling, Muscat of Alexandria, White Tokay, and Black Alicante, 3s. each. The above are well ripened, short-jointed stuff. W. G. CALDWELL AND SONS, The Nurseries, Knutsford, Cheshire.

Now Ready.

THE LAWSON COMPANY'S NURSERY CATALOGUE for 1878; will be forwarded free on application. THE LAWSON SEED and NURSERY COMPANY (Limited), Edinburgh and London.

Special Offer of large Standard Fruit-bearing PLUM TREES.

R. AND G. NEAL have the above to offer in extra large plants, well-rooted, and in fine condition for removal. Price, with List of Sorts, on application. Also, extra fine RHUBARB for Forcing, viz.: Early Albert, Victoria, Sovereign, and Myatt's Linneus. The Nurseries, Wandsworth Common, S.W.

A S P E C I A L L Y C H E A P OFFER.

ASH, 2 to 3 1/2 feet; BIRCH, 1 1/2 to 2 and 2 to 3 feet; ALDER, 2 1/2 to 3 1/2 and 3 1/2 to 5 feet; LARCH, 1 1/2 to 2 and 2 1/2 to 4 1/2 feet; SPRUCE, 1 1/2 to 2 feet; SCOTCH, 1 1/2 to 2 feet; BIRCH, 8 to 10, and 10 to 12 feet; CHESTNUTS, Horse, 8 to 10, and 10 to 12 feet; LAUREL, Colchic, 4 to 5 feet; SYCAMORE, 4 to 5, and 5 to 6 feet; LABURNUM, English and Scotch, 2-yr.; ACER NEGUNDO, 2-yr.; AILANTHUS GLANDULOSA, 2-yr.; BROOM, Common, 2-yr. seedlings; DECIDUOUS FLOWERING SHRUBS in variety, 30s. per 100. Preston Nursery Company, Preston.

WILLIAM THROUGHTON, Manager.

WELLINGTONIA GIGANTEA, 50 fine plants, 5 to 6 feet, in large pots, 10s. 6d. each. Also 400 CEDRUS DEODARA, 10 to 15 feet, in pots, all safe to transplant, at 10s. 6d. each.

A large assortment of tall EVERGREEN TREES, 8 to 10 feet and upwards, grown expressly for Screens, Blinds, and Planting for Immediate Effect.

WM. MAULE AND SONS, The Nurseries, Bristol.

Cover Planting, &c.

SAMUEL and JAMES SMITH (late J. Smith, Sen.), Tansley Nurseries, near Matlock, Derbyshire, have the following in large quantities, viz.:—RHODODENDRON PONTICUM, 1 1/2 to 2 feet, 20s. per 100, 180s. per 1000; 2 to 3 feet, 30s. per 100, 180s. per 1000; 3 to 4 feet, 30s. per 100, 200s. per 1000; 5-yr. seedling, 12s. per 1000, £50 per 100,000.

BROOM, 1-yr. seedling, 2s. 6d. per 1000, 20s. per 10,000; 2-yr. do., 4s. per 1000, 30s. per 10,000.

GORSE, 1-yr., 2s. per 1000, 25s. per 20,000.

Nursery LIST on application.

To the Trade Only, for Cash on Delivery.

DIELYTRA SPECTABILIS, strong, 20s. per 100. VESUVIUS GERANIAM, bloom splendid trusses, 10s. per gross.

THOMAS KITLEY, Oldfield Nursery, Bath.

Fruit and Forest Trees, Ornamental Shrubs, SEEDS, &c.

J. SCOTT, The Royal Nurseries, Merriott, Somerset, has to offer large and fine Collections of the above, in large and small quantities, and at moderate prices; all are in excellent health and well rooted. The "ORCHARDIST" price 3s. 6d. The best work on Fruit Trees and their cultivation in the English language.

Vines—Vines—Vines.

J. COWAN, The Vineyard, Garston, near Liverpool, has still on hand several thousands of strong, well ripened VINES. Fruiting Canes, 10s. 6d. to 12s. 6d. each; Planting Canes, 5s. to 7s. 6d. each. Catalogues free. Trade supplied. Terms on application.

American Grown Tuberose Roots.

TUBEROSE ROOTS, of my own growing, finest quality Roots, £5 per 1000.

EULALIE JAPONICA VARIETATA, £2 per 1000.

FRANKLENIA PUBESCENS, 2 to 4 feet, 15s. per dozen.

All packed free; freight by steamer, Baltimore to Liverpool, low. JOHN SAUL, Washington, D.C., U. S. America.

ROSES, Dwarf Hybrid Perpetuals, very strong, of leading sorts, on Manetti Stock; these, being budded so low as to be scarcely any of the stock, are admirably adapted for pots or beds; 9s. to 12s. per dozen, 70s. per 1000.

UCCIA RECURVA, fine specimens, about 2 feet, 3s. 6d. each.

PYRACANTHA, Red-berried, hardy plants, 1-yr., in 4-inch pots, 4 to 6 inches, 3s. per dozen, 21s. per 100.

2-yr., in 5-inch pots, 5s. per dozen.

H. MCMILLAN, St. James' Road Nursery, Kingston-on-Thames.

MYROBALAN, or CHERRY PLUM, is the best stuff for Mending Old Fences or Making New Ones. It grows vigorously in the poorest soils, even where Whitethorn will hardly exist, and bears clipping like Whitethorn. Its stiff hard branches, and dangerous spines or thorns, effectually prevent cattle or evil-disposed persons from getting through Fences made of it. Plant from four to six in a yard. Sizes and prices on application to E. W. AND COMPANY, The Royal Norfolk Nurseries, Eaton, near Norwich.

NEW PEA, "CRITERION" (Standish).

JAMES VEITCH & SONS

DESIRE TO DIRECT ATTENTION TO

THIS EXCEEDINGLY FINE NEW MAIN CROP PEA.

It is one of several seedlings raised by the late Mr. John Standish, who for some years devoted much attention to hybridising and improving the quality of this vegetable, and from whose Executors J. V. & Sons have purchased the whole stock of his Seedling Peas.

Criterion is supposed to be a cross between Advancer and Ne Plus Ultra, and was considered by the raiser to be one of the finest of his seedlings. In general appearance it partakes much of the character of the Ne Plus Ultra, while, as a second early, coming into use somewhat in advance of Champion of England, it is valuable on account of its fine quality and free cropping properties.

The plant is of a strong robust branching habit, and grows from 5 to 6 feet in height. The pods, which are produced in pairs, are of a deep olive-green shade and exceedingly well filled, generally containing from seven to nine Peas. These are of a fine deep green colour, and remain a long time fit for use. When boiled they are of a fine rich flavour, and retaining their beautiful deep green shade of colour, have a very attractive appearance on the table.

Mr. DRAPER, *The Gardens, Seaham Hall*, says:—"Your New Pea has proved to be a first-class sort, suitable for general crop. It has six to eight Peas in a pod, of large size, and it is also a good cropper, and the pods are well filled. I exhibited it at the Seaham Horticultural Show, and got First Prize, against seven others."

Mr. JONES, *The Gardens, Bentley Priory*, says:—"I have formed a very decided and favourable opinion of your New Pea, Criterion. With me it grew about 4½ feet high, with a mass of beautiful green pods, averaging eight Peas in each, with the look and flavour of Ne Plus Ultra, and being so early I think it just the Pea wanted."

From *The Florist*:—"Messrs. Standish & Co., of Ascot, who have raised a very promising batch of New Peas, have just adopted the name of 'The Criterion' for that which has been set apart as the best of the series. It is in every way an excellent Pea. Being one of the Wrinkled Marrows it has a fine sweet flavour. It is in use a fortnight earlier than Ne Plus Ultra, and is a good bearer, with well filled pods, resembling those of Laxton's Supreme, and having thick fleshy husks. When cooked it is of grass-green colour, and, being of a delicate texture, it will, it is said, keep longer in use than any other Pea, partaking, in this and in other respects, of the character of Ne Plus Ultra, which was one of its parents. We look upon the Criterion as one of the most valuable of the New Peas."

Mr. BRESE, *The Gardens, Petworth Park*, says:—"Criterion was sown under the same conditions and on the same day as British Queen and Ne Plus Ultra. I think it is a finer looking Pea than either of these, a heavier cropper and finer looking pod, and quite a week earlier. It is undoubtedly a good Pea."

Mr. MCINDOE, *The Gardens, Hutton Hall*, says:—"Criterion, when boiled, has a beautiful dark green colour and a most delicious flavour. I think it cannot fail to become a great favourite where high-class deep green Marrow Peas are esteemed."

Mr. GILBERT, *The Gardens, Burghley*, says:—"Through your kindness I am enabled to give an opinion of Standish's New Pea, Criterion. My small packet was all sown in pots in one of the cool houses, planted out in April, withstood such a succession of cold, stormy, and frosty weather that I despaired of ever getting any Peas at all, nevertheless they braved it all and were ready for picking June 18. Criterion Pea grows from 5½ to 6 feet high; a Green Marrow of the most delicious flavour, bearing in pairs from sixteen to eighteen pods, with an average of eight Peas in each. It is the hardest and best Pea of the British Queen type."

Mr. SPEED, *The Gardens, Chatsworth*, remarks:—"It is the finest of all late Peas that I know and is an excellent flavour and good colour when cooked."

Price, 5s. per Quart.

PRICE TO THE TRADE ON APPLICATION.

SEED CATALOGUE,

Containing Select LISTS of New and Choice VEGETABLE and FLOWER SEEDS, EXHIBITION POTATOS, GARDEN IMPLEMENTS, &c., is now published, and will be forwarded Post-free on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

THE
ILLUSTRATED GUIDE

FOR
AMATEUR GARDENERS,

Spring, 1878.

Containing 116 pages of beautifully illustrated Letterpress, complete Directions for the successful Management of the Kitchen Garden and Flower Garden throughout the year, with Original Articles on the Cultivation of various Flowers and Vegetables, a Select List of Choice Kitchen Garden and Flower Seeds, Lilies, Gladioli, Seed Potatos, &c. Also a superbly finished Coloured Plate, the whole enclosed in a charmingly beautiful Cover of a new and elegant design.

This will be found by far the most splendid and useful Seed Catalogue ever published, and should be read by every one having a Garden.

Price 1s., post-free. Gratis to Customers.

OPINIONS FROM THE PRESS.

"For a long time Messrs. Daniels Brothers have been noted for their exquisite taste in design and colour manifested by their Catalogues, and we have to say of their *Illustrated Guide for Amateur Gardeners* for the present spring, that it is quite up to the high standard which this firm aims at." *The Farmer.*

"This is the most tasteful and best executed thing of the kind we ever remember having seen." *The Country.*

"Profusely illustrated, and the coloured plates are quite beyond the average of book illustrations." *Liverpool Mercury.*

SUTTON'S
AMATEUR'S GUIDE
IN HORTICULTURE

Is beautifully Illustrated with several handsome Coloured Plates and Hundreds of Engravings, and includes Articles on the following subjects:—

A YEAR'S WORK in the KITCHEN GARDEN—January to December.

THE ROTATION of CROPS in the KITCHEN GARDEN.

THE CULTIVATION of VEGETABLES.

THE CULTIVATION of FLOWERS.

THE CULTIVATION of the POTATO.

THE ERADICATION of GARDEN PESTS—Insect Plagues and Specific Remedies for their Destruction.

THE LAYING-DOWN and IMPROVEMENT of GARDEN LAWNS, CROQUET GROUNDS, &c.

With a Descriptive List of the Best Vegetables, Flowers, and Potatos.

From the Head Gardener to H.R.H. the Prince of Wales, K.G., to whom Messrs. Sutton are the specially appointed Seedsmen: "The Seeds supplied by you have always given the greatest satisfaction." CHARLES PENNEY. Sandringham, January 17, 1877.

Extracts from the numerous favourable opinions of the Press on Sutton's Amateurs' Guide:—

"It would be difficult to find any work on gardening more essential to amateur gardeners, in fact, it may be defined as a plain and easy guide to all who want to know. The instructions are at once clear, sound, and complete; then there are the plants themselves rendered with a truthfulness to Nature that reflects the highest credit. It literally glows with beauty, and is a perfect work of high art." *The Farmer.*

"We cannot speak too highly of the contents or of the artistic manner in which it has been got up. Messrs. Sutton are, we think, justified in regarding the Guide as the most practical and complete work of its kind yet published." *Bell's Weekly Messenger.*

Sutton Sons

THE QUEEN'S SEEDSMEN, READING.

SATURDAY, DECEMBER 29, 1877.

GROWTH UNDER DIFFICULTIES.

PLANTS often set us mortals an example we should do well to follow. When adversity comes they are not, as some of us are, overwhelmed and reduced to the inaction of despair; they seem to act on the principle that a difficulty is a thing to be overcome, and if they cannot effect it in one way they will in another. This great pliability of plant-life—this adaptation to varied conditions and circumstances, strikes us every day, and never more forcibly perhaps than in reference to the various methods of treatment applied to the Grape Vine. It might have been thought that the main lines of practice were sufficiently laid down by this time, but experience shows how great is the conflict of opinion upon a point of everyday practice. Experience also shows that, disregarding extreme and exceptional cases, the general results are much the same. Skill and care go for much—for very much; but all the skill and all the care would avail nought if the plant did not lend itself to the practitioner, and meet his advances much more than half way.

The following communication, with which we have been favoured by Mr. Darwin, affords us another illustration of similar character:—

"The enclosed branch of Cotyledon (*Echeveria stolonifera*) was cut from a plant growing in my greenhouse, and was suspended on August 10 in my study, which is a dry room, and in which a fire burns most of the year. It has sent out the two fine flowering stems which, from the position in which the branch was hung, have bent upwards [as may be seen in the figure]. They have now (December 6) begun to flower. You will see that the plant has sent out a number of small roots. I may add that the specimen weighed on September 1 45.46 grammes, on December 6 36.94 grammes, so that its growth has continued in spite of a considerable loss from evaporation. *Charles Darwin, Down, Beckenham.*"

Mr. Darwin was kind enough to furnish us with the specimen from which the accompanying figure, was taken (fig. 159) It is of interest for several reasons—first, as showing how long life may be manifested with only a scanty supply of food from the air and the water therein. Growth in the form of the addition of new matter can hardly be expected to any extent, so that it is not surprising that a loss of weight of about 10 grammes (a gramme = 15 grains, about) took place between September 1 and December 6—a loss which would probably have been greater but for the leathery rind of the leaves. But while actual growth, in the sense of increased bulk, has been checked, the course of progressive development has advanced to such a degree that two flowering shoots with their appropriate form of leaf, and with their still more widely different floral leaves, have been formed. The mysterious tendency for the stem to ascend is manifested here as markedly as it usually is. Bromeliads manage to exist in a rootless state when hung up in our stoves, but they are more liberally treated in the way of moisture than Mr. Darwin's *Echeveria* was. M. Duchartre submitted some plants of this character to experiment with a view to determine what part of the rootless plant absorbed the water, and he ascertained that it was the butt end of the stem which fulfilled the function in question under those peculiar circumstances, and he, moreover, showed that watery vapour was not absorbed by the plant but water itself in a liquid state. Many years before

Mr. M'Nab, now of the Royal Botanic Garden, Edinburgh, made some experiments on the growth of plants in an inverted condition, and which were recorded in our columns at the time (August 14, 1841). In one case related by Mr. M'Nab an Indiarubber plant was knocked out of a pot, its roots cleansed and itself suspended from the rafters of the house, receiving only the moisture derived from the syringing operations. For three years the plant existed, and was still alive and healthy at the time of the report.

FIG. 153.—PHLEBODIUM AUREUM.

A second specimen (fig. 155), originally of the same size, was more liberally treated, being supplied with moisture by means of a thread depending siphon-wise from a vessel of water hung above it. The plant in question was quite healthy, though the roots were freely exposed to the light.

Another specimen (fig. 156) was hung upside down, like Mr. Darwin's Echeveria, and supplied with water as in the previous case. At

FIG. 154.—PHLEBODIUM AUREUM INVERTED.

first the plant resented the treatment, its heart rotted, its leaves fell off, but after a time new buds made their appearance, which ultimately turned up, as shown in fig. 156. This plant also grew for several years.

Other instances of inverted growth are represented by Polypodium (Phlebodium) aureum, the fronds of which hung down. Mr. M'Nab

FIG. 155.—INDIARUBBER PLANT (SEE TEXT).

FIG. 156.—INDIARUBBER PLANT (SEE TEXT).

suspended the plant upside down, as shown in fig. 154, and the fronds then assumed an upward direction, and allowed the fructification to become visible—an advantage from a decorative point of view.

Platyterium alcorni is another illustration of like kind (see fig. 157). Our last illustration, also supplied by Mr. M'Nab, shows a plant of

FIG. 157.—PLATYTERIUM ALCORNE.

Bilbergia nudicaulis, which was hung up from the roof of a stove, flowered in one season, then produced a shoot which in the following year flowered; and so the process of shoot and flower-forming went on year after year, the plant being rootless and feeding on the water collected between the leaves. When first hung up it was not more than 1 foot long, but it had attained at the date of the report to

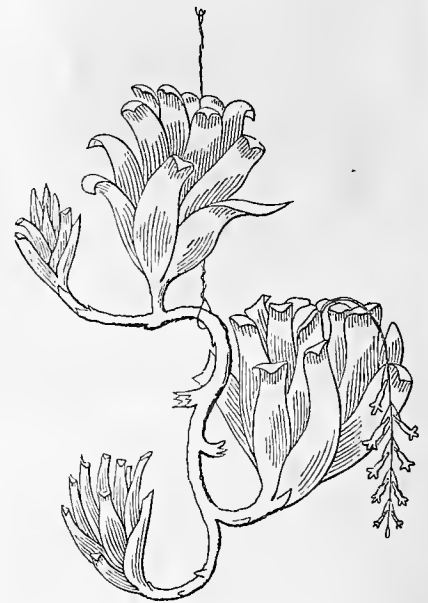

FIG. 158.—BILBERGIA NUDICAULIS.

2 feet 6 inches, and was then producing shoots at both ends.

Space will not allow us at present to comment longer on these facts; but they will excite the admiration of those who love to probe the workings of Nature, and supply matter for the thoughtful practitioner to ponder over and turn to advantage.

THE GENUS AGAVE.

(Concluded from p. 781.)

SERIES IV. — CARNOSE-HERBACEÆ. — Leaves almost herbaceous in texture, dying down annually, often spotted with brown, the tip not at all pungent, the margin entire, or at most minutely serrulate. Flowers few, solitary, laxly spicato-racemose = *Manfreda*, Salisb.

These form a most distinct group, worthy, I think,

Notes, p. 13; Fenzl in Gard. Chron., 1872, p. 1194, t. 273. — Acaulescent. Leaves 12—20 in a rosette, lanceolate, spreading, $\frac{1}{2}$ —1 foot long, $\frac{3}{4}$ —1 inch broad below the middle, narrowed slightly downwards, glaucous green, deeply channelled, mottled on both sides with irregular brownish blotches, the edges distinctly serrulate. Scape $1\frac{1}{2}$ —3 feet long below the inflorescence, furnished with a few lanceolate bract-leaves. Flowers in a lax subspicate raceme $\frac{1}{2}$ —1 foot long; pedicels very short; bracts small, lanceolate, acuminate. Perianth purplish-green, $1\frac{1}{2}$ —2 inches long; ovary oblong, under

gathered by Mr. C. Wright (var. *brevituba*, Engelm., Notes, p. 13); but in our specimens of the same gathering, whilst the upper flowers of the spike have the tube nearly obliterated, the lower ones have it as long as in the ordinary form. Jacobi, in his first *Nachtrage*, p. 48, describes a variety *minor*, in which the leaves reach only 3 or 4 inches in length, and a third of an inch in breadth. This species may be readily distinguished from all the other *Manfredas* by its short stamens and distinctly-toothed leaves.

** Filaments much longer than the perianth segments.
† Perianth segments shorter than the tube.

104. *A. (Manfreda) virginica*, Linn. Sp. Plant., edit. ii., p. 416; Jacq., Ic., t. 378; Bot. Mag., t. 1157; Kunth, Enum., vol. v., p. 833; Jacobi, Monogr., p. 174; Engelm., Notes, p. 13, but not of Miller, which is a variety of *A. americana*. — Acaulescent. Leaves 10—15 in a rosette, spreading, lanceolate, 6—12 inches long, $1-1\frac{1}{2}$ inch broad below the middle, narrowed gradually to the point and a little downwards, channelled down the face, undulated, plain green or mottled with brown spots, — the narrow cartilaginous margin very obscurely serrulate. Scape 2—3 feet high, exclusive of the spike, with only a few distant small bract-leaves. Spike very lax, 1—1 $\frac{1}{2}$ foot long; lower flowers with very short pedicels; bracts lanceolate, those of the lower flowers $\frac{1}{2}$ — $\frac{3}{4}$ inch long. Perianth greenish-yellow, $1-1\frac{1}{2}$ inch long, including the ovary; ovary oblong, $\frac{3}{4}$ — $\frac{1}{2}$ inch long; tube $\frac{1}{2}$ — $\frac{3}{4}$ inch long in the lower flowers, little dilated from the base to the throat; segments linear-oblong, $\frac{1}{2}$ — $\frac{3}{4}$ inch long. Filaments inserted below the throat of the tube, exerted $\frac{1}{2}$ —1 inch; anthers $\frac{1}{2}$ inch long. Style reaching to the top of the filaments. Capsule nearly globose, $\frac{1}{2}$ — $\frac{3}{4}$ inch long, cuspidate and subpedicellate; seeds black, discoid, semi-circular, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad.

Widely spread through the Southern United States. Dr. Engelmann describes a variety *tigrina*, a robust form with beautifully mottled leaves 1—1 $\frac{1}{2}$ foot long, 2 $\frac{1}{2}$ —3 inches broad, gathered by Dr. Mellichamp, near salt marshes, on the coast of South Carolina. *A. conduplicata*, Jacobi and Bauche, Monogr., p. 192, sent from Mexico by Ehrhberg, unknown in flower, is said to be closely allied to *A. virginica*.

105. *A. (Manfreda) brachystachys*, Cavan. Descr. (1802), p. 453; Kunth, Enum., vol. v., p. 829; Jacobi, Monogr., p. 184; *A. spicata*, D. C., in Red. Lil., t. 485, non Cavan.; *A. polyanthoides*, Cham. and Schlecht. in Linnaea, vol. vi., p. 55; *A. saponaria*, Lindl. in Bot. Reg., vol. xxiv., Misc., p. 76; vol. xxv., tab. 55; Jacobi, Monogr., p. 179; *A. humilis*, Roem. Amaryll., p. 15. — Acaulescent. Leaves 10—12 or more in a rosette, spreading, lanceolate, 1—1 $\frac{1}{2}$ foot long, $1-1\frac{1}{2}$ inch broad below the middle, narrowed gradually to the point and a little downwards, channelled down the face, plain green, glabrous, the narrow cartilaginous edge very obscurely serrulate. Scape 3—4 feet long exclusive of the spike, with a few distant lanceolate bract-leaves. Spike lax, 1 foot or more long; flowers 20—40. Bracts lanceolate acuminate, those of the lower flowers 1 inch long. Perianth 2—2 $\frac{1}{2}$ inches long, inclusive of the $\frac{1}{2}$ inch oblong-cylindrical ovary; tube $\frac{3}{4}$ —1 inch long, cylindrical in the lower half; segments greenish-yellow, spreading, linear-oblong, about $\frac{1}{2}$ inch long. Filaments purple, inserted below the throat of the tube, exerted $\frac{1}{2}$ — $\frac{3}{4}$ inch beyond the tip of the segments; anthers $\frac{1}{2}$ inch long. Style overtopping the filaments; stigma deeply 3-lobed. Capsule seen immature only, oblong, $\frac{3}{4}$ inch long.

A native of Mexico, introduced to the Madrid garden at the beginning of the century. The best published figure is that of the *Botanical Register*, under the name of *A. saponaria*. We have an excellent unpublished drawing in the Kew collection, made from a plant that flowered, in the garden about 1830, from seeds sent by Deppe. We have a living plant at Kew at the present time, contributed by the Rev. H. N. Ellacombe, and dried specimens have been distributed by Dr. Harvey from Zimapan as No. 1555 of Dr. Coulter's gatherings.

106. *A. (Manfreda) pubescens*, Regel and Ortgies, in Gartenflora, 1874, p. 227, tab. 801. — Acaulescent. Leaves 12—15 in a rosette, spreading, lanceolate, 1 foot long, 1 $\frac{1}{2}$ inch broad below the middle, subentire, both sides opaque green mottled with brown, and densely pubescent. Scape 3 feet long, distantly bracteate. Spike $\frac{1}{2}$ a foot long, laxly 12—15 flowered; bracts small, lanceolate. Perianth greenish, $1\frac{1}{2}$ inch long; ovary oblong, $\frac{1}{2}$ inch; tube twice as long as the segments, cylindrical in the lower half; segments linear-oblong, $\frac{1}{2}$ — $\frac{3}{4}$ inch long. Filaments and style much protruded beyond the tip of the segments.

Discovered in Mexico by M. Roezl about 1870. I have not yet seen it in any of the English collections.

FIG. 159.—COTYLEDON (ECHEVERIA) STOLONIFERA. (SEE P. 805).

of separation from Agave as a sub-genus, in which habit and leaf-character and short life-duration run parallel with a well-marked distinctive type of inflorescence. The best characters by which to discriminate the species appear to be found in the relative length of the genitalia, perianth-segments and perianth-tube, and in the shape of the latter.

* Filaments not longer than the perianth-segments.

103. *A. (Manfreda) maculata*, Regel, Ind. Sem. Hort. Petrop., 1856, p. 16; Gartenflora, 1857, p. 158; 1858, p. 314; Engelm. in Torrey, Bot. Mex. Bound., p. 214; Jacobi, Monogr., p. 171; *A. maculosa*, Hook. in Bot. Mag., t. 5122 (1859); Jacobi, Monogr., p. 170; Engelm.,

$\frac{1}{2}$ inch long; tube usually $\frac{3}{4}$ —1 inch long, cylindrical in the lower half; segments linear-oblong, $\frac{1}{2}$ — $\frac{3}{4}$ inch long. Filaments inserted at the throat of the tube, not longer than the segments. Anthers about $\frac{1}{2}$ inch long. Style just exerted from the perianth-segments. Stigma deeply 3-lobed. Capsule globose or oblong, $\frac{1}{2}$ — $\frac{3}{4}$ inch long in our specimens (reaching $1\frac{1}{2}$ inch according to Dr. Engelmann), cuspidate. Seeds black, shining, discoid, semicircular, $\frac{1}{4}$ — $\frac{1}{2}$ inch broad.

A native of Texas and the North of Mexico. A full account of the plant with a coloured figure will be found in the *Botanical Magazine*, from a specimen that flowered at Kew in 1859. Dr. Engelmann draws attention to a form with a very short tube

It; alliance is evidently close with *A. brachystachys*. It is the only known *Agave* with pubescent leaves.

†† Segments about the same length as the tube.

107. *A. (Manfreda) variegata*, Jacobi, Monogr., p. 180; Baker, in Saund. Ref. Bot., t. 326; Engelm., Notes, p. 15.—Acaulescent. Leaves 15—18 in a rosette, spreading, lorate-lanceolate, finally 12—15 inches long, 1—2 inches broad below the middle, narrowed slightly downwards and gradually to the point, deeply channelled down the face, and copiously spotted with brown on a green ground, the narrow cartilaginous edge very obscurely serrulate. Scape 2 feet long, exclusive of the inflorescence, bearing about a dozen lanceolate bract-leaves. Spike about a foot long, 15—20-flowered; bracts minute, deltoid. Perianth greenish, 15—18 lines long; ovary oblong, 5—6 lines; tube equalling in length the oblong segments, gradually dilated from the base to the throat. Filaments inserted below the throat of the tube, reddish-brown, 2—2½ inches long; anthers ½ inch. Style at last overtopping the stamens. Capsule oblong, under 1 inch long; seeds ½ inch in diameter.

Discovered by Dr. Gregg, in 1847, on the lower part of the Rio Grande, near Matamoros. A full account of the plant, with a coloured figure, will be found in the *Refugium*, from a specimen that flowered with Mr. Saunders in 1870. We have it at Kew at the present time.

108. *A. (Manfreda) revoluta*, Klotzsch, in Otto and Dietr., Gartenzeit., 1840, p. 274; Kunth, Enum., vol. v., p. 830; Jacobi, Monogr., p. 189.—Leaves linear-lanceolate, channelled, 6—8 inches long, 7—9 lines broad near the base, plain green, pruinose beneath, recurvato-patent, the edge narrowly cartilaginous, entire. Scape 4 feet long, glaucous. Spike dense; bracts ovate. Perianth greenish, 16—17 lines long, exclusive of the ovary; ovary oblong, equalling in length the tube, and linear-oblong segments. Stamens inserted below the throat of the tube, exerted. Style falling short of the filaments; stigma obscurely 3-lobed.

A native of Mexico, introduced to the Berlin garden in 1840. I have not seen it in England.

††† Perianth-segments shorter than the tube.

109. *A. (Manfreda) guttata*, Jacobi and Bouché, Monogr., p. 190; Nachtrage, ii., p. 87.—Acaulescent. Leaves few, lanceolate, 15—16 inches long, 2 inches broad below the middle, deeply conduplicate, bright green above, paler beneath, with subpruinose striæ, both sides spotted with small reddish brown blotches, the narrow cartilaginous border subtinted. Perianth, including the ovary, 1½ inch long; ovary cylindrical, ½ inch; segments twice as long as the tube. Filaments nearly 2 inches long; anthers ½ inch.

A native of Mexico, introduced to the Berlin garden by Ehrenberg about 1860, and flowered there in 1870. Not seen in any of the English collections.

110. *A. (Manfreda) undulata*, Klotzsch, in Otto and Dietr., Gartenzeit., 1840, p. 274; Kunth, Enum., vol. v., p. 830; Jacobi, Monogr., p. 189; Nachtrage, ii., p. 89; Regel, Gartenflora, 1858, p. 314; *A. drimycifolia*, H. et Petrop.—Leaves lanceolate, 1½ foot long, 1½ inch broad below the middle, narrowed a little downwards and gradually to the point, deeply channelled, dull green, pruinose on both sides, not spotted, reddish beneath towards the base, much undulated, the narrow cartilaginous border obscurely serrulate. Scape 3—4 feet long. Perianth above 1½ inch long, including the ovary; ovary under ½ inch long; segments twice as long as the limb. Filaments much exerted; anthers under ½ inch long.

A native of Mexico. Introduced to the Berlin garden in 1840, and flowered there in 1869. Not seen in any of the English collections.

A KEY TO THE KNOWN SPECIES OF AGAVE.

- Key to subgenera founded on inflorescence:—
Flowers in clusters, which are crowded at the end of the branches of a broad deltoid panicle. 1. EUAGAVE.
Flowers in pairs, forming a dense cylindrical nearly spicate panicle. 2. LITTEA.
Flowers solitary, forming a lax, simple, subsperate raceme. 3. MANFREDA
Key to series founded on leaf-texture:—
Leaves persistent, both rigid and thick in texture, not at all flexible. 1. CORIACEO-CARNOSÆ.
End-spine large and pungent.
Leaves persistent, more fleshy and less rigid in texture than in the last. End-spine smaller and less pungent. 2. CARNOSO-CORIACEÆ.
Leaves persistent, thin, and flexible, but at the same time firm and rather fleshy in texture. End-spine generally small, subpungent. 3. FLEXILES.
Leaves dying down annually, thin and almost herbaceous in texture, with the tip not at all pungent. 4. HERBACEÆ.

In the following key the species are arranged according to leaf-texture. When the inflorescence is known the name of the subgenus is mentioned, so that where no subgenus is given, the flowers have not been examined. The species of which sufficient coloured

figures have appeared in the *Botanical Magazine*, or other horticultural periodicals, have their names printed in capitals; those others of which I have seen specimens in the English collections have their names printed in italics, and the remainder—those which so far as I know are not to be found in England at all—have their names printed in Roman characters. Respecting all, therefore, except those species the names of which are printed in capitals, further information is needed.

Series I. CARNOSO-CORIACEÆ.

Group I. FILIFERÆ.—Edge of the leaf splitting off into distinct threads.

- 1. *A. (LITTEA) FILIFERA* | 3. *A. (LITTEA) Schottii*
2. *A. (LITTEA) SCHNIDIGERA* | 4. *A. (LITTEA) parviflora*

Group II. MARGINATÆ.—Edge of the leaf furnished with a toothed continuous horny border from top to bottom.

* Leaves ensiform, hardly at all narrowed at the base.

† Grandifoliæ.

- 5. *A. (LITTEA) lophanta* | 7. *A. (LITTEA) HETTERA-*
6. *A. (LITTEA) UNIVIT-* | 8. *A. splendens*
TATA | 9. *A. (LITTEA) NYLACANTHA*

†† Parvifoliæ.

- 10. *A. (LITTEA) POSELGERII* | 12. *A. Nissoni*
11. *A. Kerchovi* | 13. *A. Rocaziana*
14. *A. Victoriae-Regina.*

** Leaves decidedly narrowed from the middle downwards.

† Grandifoliæ.

- 15. *A. Vanderwinni* | 16. *A. Demeesteriana*

†† Parvifoliæ.

- 17. *A. Gheisbreghtii* | 19. *A. horrida*
18. *A. Peacockii*

Group III. SUBMARGINATÆ.—Edge of the leaf toothed, and furnished with a distinct horny border in the upper part.

* Parvifoliæ.

- 20. *A. (EUAGAVE) Deserti* | 22. *A. applanata*
21. *A. (EUAGAVE) Sharuii*

** Grandifoliæ.

- 23. *A. Hookeri* | 25. *A. (EUAGAVE) latissima*
24. *A. (EUAGAVE) Salmiana*

Group IV. AMERICANÆ.—Edge of the leaf without any continuous horny border below the tip; teeth large, deltoid, with the margin repand between them.

* Leaves oblong-spathulate.

- 26. *A. (EUAGAVE) Secman-* | 29. *A. (EUAGAVE) SCOLYMUS*
niana | 30. *A. (EUAGAVE) potatorum*
27. *A. (EUAGAVE) Parryi* | 31. *A. ferox*
28. *A. (EUAGAVE) Wislizeni*, | 32. *A. Galeottii*

** Leaves oblanceolate-spathulate.

* Parvifoliæ.

- 33. *A. falcata* | 36. *A. (LITTEA) MACRA-*
34. *A. viridissima* | 37. *A. concinna*
35. *A. (LITTEA) utahensis*

** Grandifoliæ.

- 38. *A. (EUAGAVE) Palmeri* | 41. *A. Maximiliana*
39. *A. (EUAGAVE) Theometi* | 42. *A. (EUAGAVE) mexicana*
40. *A. coccinea* | 43. *A. (EUAGAVE) AMERICANA*

Group V. RIGIDÆ.—Edge of the leaf without any continuous horny border below the tip; teeth small, the edge not repand between them.

* Leaves oblong-spathulate.

- 44. *A. Decaisneana* | 46. *A. (LITTEA) BOTTERII*
45. *A. Warelliana*

** Leaves oblanceolate-spathulate.

- 47. *A. (EUAGAVE) miradorensis* | 51. *A. Corderoyi*
48. *A. (EUAGAVE) LURIDA* | 52. *A. Regaliana*
49. *A. (EUAGAVE) IXTLI* | 53. *A. (LITTEA) polyacantha*
50. *A. exelsa* | 54. *A. (LITTEA) DENSIFLORA*
55. *A. Salm-Dyckii*

Group VI. STRIATÆ.—Edge of the leaf minutely serrulate; surface strongly ribbed.

- 56. *A. (LITTEA) STRIATA* | 58. *A. (LITTEA) DASYLIRI-*
57. *A. (LITTEA) californica* | OIDES.

Group VII. INTEGRIFOLIÆ.—Edge of the leaf entire; surface not ribbed.

- 59. *A. (EUAGAVE) Newberryi* | 60. *A. Houletii*

Series II. CARNOSO-CORIACEÆ.

Group VIII. GEMINIFLORÆ.—Edge of the leaf splitting off into threads as in the *Filiferæ*.

61. *A. (LITTEA) GEMINIFLORA.*

Group IX. ALOIDEÆ.—Edge of the leaf furnished with small but distinct teeth.

* Leaves oblong-spathulate.

- 62. *A. regia* | 66. *A. Offoyana*
63. *A. melanacantha* | 67. *A. (LITTEA) CRUSIANA*
64. *A. rudis* | 68. *A. (LITTEA) Ehrenbergii*
65. *A. Laurentiana* | 69. *A. Lindleyi*

** Leaves oblanceolate or ensiform.

† Grandifoliæ.

- 70. *A. (LITTEA) Goeppertiana* | 76. *A. (A. Litteæ) oblongata*
71. *A. Smithiana* | 77. *A. (LITTEA) Haseloffii*
72. *A. (LITTEA) horizontalis* | 78. *A. (LITTEA) Mullmanni*
73. *A. Humboldtiana* | 79. *A. Martiana*
74. *A. Kerchovi* | 80. *A. Martiana*
75. *A. (LITTEA) Sartorii*

†† Parvifoliæ.

- 81. *A. Bernhardii* | 86. *A. (LITTEA) albicans*
82. *A. (LITTEA) RUFICOLA* | 87. *A. Thompsoniana*
83. *A. (LITTEA) Bonchei* | 88. *A. Wallisii*
84. *A. (LITTEA) MICRACAN-* | 89. *A. (LITTEA) chloracantha*
85. *A. (LITTEA) mitis* | 90. *A. Brantiana*

Group X. SERRULATÆ.—Leaves minutely serrulate.

91. *A. pruinosa*

Group XI. ATTENUATÆ.—Edge of leaves entire.

- 92. *A. (LITTEA) ATTENU-* | 93. *A. (LITTEA) ELEMETI-*
ATA | ANA

Series III. FLEXILES.

Group XII. VIVIPARÆ.—Leaves distinctly toothed. End-spine subpungent.

* Leaves linear-ensiform.

- 94. *A. pugioniformis* | 95. *A. serrulata*

** Leaves lanceolate.

- 96. *A. rubescens* | 98. *A. laxa*
97. *A. (EUAGAVE) vivipara* | 99. *A. bromeliifolia*

*** Leaves oblanceolate-oblong.

- 100. *A. (EUAGAVE) sobolifera*

Group XIII. YUCCÆFOLIÆ.—Leaves subtinted or obscurely serrulate. End-spine not pungent.

- 101. *A. (LITTEA) YUCCÆ-* | 102. *A. (LITTEA) spicata*
FOLIA

Series IV. HERBACEÆ.

* Filaments not longer than the perianth-segments.

103. *A. (MANFREDA) MACULATA*

** Filaments much longer than the perianth-segments.

† Perianth-segments shorter than the tube.

- 104. *A. (MANFREDA) VIR-* | 105. *A. (MANFREDA) BRACHY-*
GINICA | STACHYS
106. *A. (MANFREDA) PUBESCENS.*

†† Perianth-segments as long as the tube.

- 107. *A. (MANFREDA) VARIE-* | 108. *A. (Manfreda) revoluta*
GATA

††† Perianth-segments longer than the tube.

- 109. *A. (Manfreda) guttata* | 110. *A. (Manfreda) undulata*

WINTER TOKENS.

WHEN the stormcock blows his whistle
 And the tomtit files his saw,
 And the robin pipes his treble
 And the rook flies with the daw,
 And the cricket tunes his fiddle
 To the kettle's merry song,
 And the sleety blast is driving
 The poor beggar-boy along ;
 When the sea-coal fire burns brightest
 And the kittens loudest purr,
 And no music to the sportsman
 Beats the pheasant's sudden whirr ;
 When the cowherd sets his springles
 By the runnel and the mere,
 And the starlings seek the plashets
 At the belling of the deer ;
 When the colly in the coppice
 Cracks his snails upon the stone,
 And the carrion-crow sits telling
 His doleful tale alone,
 While the young thrush in the thicket
 Tries his notes o'er for the spring,
 And the wild geese, flying V-like,
 Speed swifter on the wing ;
 When the flails make merry music
 To the urchins out of school,
 And the old men seek the settle
 While the maidens card the wool ;
 When fair Nelly from the forest
 Calls the acorn-hunting swine,
 With her cheery " Chugzy, chuggy,"
 In the glow at even-chime,
 And old gossips croon their stories
 As they knit around the fires,
 And wee Jenny Wrens a-peeping
 See the poachers set their wires ;
 Then the black storms shade their mantles
 O'er the leaf forsaken trees,
 And the snipe comes with the woodcock
 And the culver seeks the leas,
 And the little lads are busy
 Making ready for the fray,
 With their cannon, logs, and crackers,
 For great Guy Fawkes his day—
 When piles of blazing bonfires
 And spiteful, hissing toys,
 As serpents, squibs, and rockets,
 Please large and lesser boys ;
 Then the skylarks flock together
 And the linnets crowding sing,
 And the children, 'mid the heather,
 Their red-rose berries string ;
 Then, the fruits all safely hoarded,
 Lo, the farmer waits for morn,
 With a shout for bleak November
 And the merry hunter's horn ;
 While the dormouse and the squirrel,
 Curling cosy in their nest,
 Tell of merry Christmas coming
 And a weary earth at rest.
Edward Capern, in " Good Words."

New Garden Plants.

IRIS (APOGON) ROSSII, Baker, n. sp.*

This is a new species of Iris of the small group of Apogon with very long tubes. It has not yet been introduced in a living state, but as I have already described all the known species in your columns I venture to ask to be allowed to add this to the list. It is an inhabitant of dry sloping banks in the province of Sching-king, in Northern China, where it was gathered in flower on April 27, 1876, by the gentleman in whose honour I have named it, Mr. John Ross. This province of Sching-king runs like a wedge between Manchuria and Corea, and its botanical productions were totally unknown till we received a considerable collection of them from Mr. Ross this present autumn. The collection has not yet been fully worked out, but I have studied the Ferns and find that, although none of them are absolutely new, it adds not less than half-a-dozen species previously known only in Japan and Manchuria, as for instance *Aspidium tripterum* and *Scolopendrium sibiricum*, to the Chinese flora. The present Iris comes nearest the West Siberian *I. humilis*, M.B., from which it may be readily distinguished by possessing a short flower-stem, by having only two leaves to each tuft and by its very short stigmas, with appendages as long as the lamina.

Densely caespitose on a slender rhizome, the tufts of leaves surrounded by clusters of bristles. Produced leaves not more than two to a tuft, linear, acuminate, glabrous, thin and grass-like in texture, 3-4 inches long at the flowering time, 1/2-3/4 inch broad. Scape always 1-flowered, very short, hardly rising above

* *Iris (Apogon) Rossii*, Baker, n. sp.—Dense caespitosa; rhizomate brevi; foliis productis geminis linearibus; scapo brevissimo unifloro; spathe valvis duabus linearibus viridibus 2-3 pollicaribus; pedicello brevi; perianthii tubo 2-3 pollicari, limbi lacini vel raro albidis segmentis exterioribus obovato-spathulatis, interioribus obovato-unguiculatis exterioribus aequilongis; stigmatibus limbo duplo brevioribus appendicibus linearibus; antheris parvis filamentis longioribus.

the soil. Spathe-valves always two, linear, green except at the very edge, 2-3 inches long. Pedicel not more than 1/4 inch long inside the spathe. Ovary cylindrical, 1/2-3/4 inch long. Perioath-tube cylindrical, 2-3 inches long. Limb lilac, or rarely white; falls obovato-spathulate, 1 inch long, under 1/2 inch broad, the claw shorter than the lamina; standards erect, 1 inch long, obovato-anguiculate. Stigmas, including the linear points, 1/2 inch long, the point equalling the undivided portion of the lamina. Anther 1/4 inch long, exceeding the filaments. *J. G. Baker.*

PRIMULA NIVALIS, Pall. var. TURKESTANICA.

It is a long time since *Primula nivalis* became known to botanists as one of the most beautiful and distinct of

FIG. 160.—PRIMULA TURKESTANICA

its race. In the volume for 1870 of the *Gartenflora*, Dr. Regel called attention to this species, and said that its introduction into Europe was one of the tasks of the naturalists of Russia. Already at that time several forms

FIG. 161.—PRIMULA TURKESTANICA.

of this species were known, the best of these being the variety called by Dr. Regel *farinosa*, a plant indigenous in the mountains of Songaria and of Kamischatka. In the course of last summer Dr. Regel's son, who is a physician attached to the Russian army in Turkestan, in travelling through the mountainous districts of Kuldsha and the Thian-Shan mountains discovered another form, which has received the name

of *turkestanica*, and which Dr. Regel says is by far the most beautiful of all *Primroses* of Central Asia.

The plant is a robust grower, has oblong flat obtuse leaves, smooth above, white powdered below. The vigorous flower-stems terminate in a many flowered umbel, standing in dense whorls, stage-like, as in *Primula japonica*. The flowers are as much as 1 inch in diameter, finely shaped, and of a bright violet colour. There occur other tinted varieties, from pale rose to deep purple in its wild state, and we may expect soon to have a variety of brilliant colours. This species, coming from one of the coldest mountainous districts of Central Asia, will probably be perfectly hardy throughout the greater part of Europe, and much more so than *P. japonica*.

The accompanying illustration (figs. 160, 161) have been drawn from a plant in its wild state, and are very true and exact representation. There is no doubt that cultivated plants will soon show larger umbels and larger flowers, but even in the state it is, this new *Primrose* will be hailed as a most valuable addition to our hardy herbaceous plants. *Haage & Schmidt, Erfurt.*

PRESERVING CUT FLOWERS.

At this time of year, when flowers are scarce and dear, every one is naturally anxious to preserve them in a nice fresh condition as long as possible, and not only this, but likewise to make the best display that can be done with a small quantity. Of all ways of showing them off, the most natural as well as the most economical is that of using any low shallow vessel either of glass or china of about the size and depth of a soup-plate. If this is filled with nice fresh wood moss made up in a slightly conical or mound-like form, the flowers and foliage can be arranged to great advantage and made to look almost as natural as if growing in the positions in which they are placed instead of having that excessively formal appearance they generally have when closely packed in a vase. Not only do they look infinitely better in this way, but they last fresh considerably longer, owing to the much larger surface exposed immediately under them, and from whence a stream of vapour is continually arising from the moss surrounding their stems. Besides the nice fresh appearance this has, it is of great use both for the above-named purpose and for keeping the flowers in any position they may be placed in, so that they may be quickly and easily arranged.

Those who have had to do with putting cut flowers in vases of water know what a bother it is to get them to remain where placed, as with the slightest touch they have a provoking way of tumbling out and bringing others with them in their fall; but with the moss there is none of this trouble, for if the ends of the stems are cut a little slanting they may be thrust in readily, especially if a way be first made for them by inserting a pointed stick. Having epergnes and opaque vases to dress, I always adopt this plan of doing them, and I find that less than half the quantity of flowers suffices to produce a far better effect than could be done as they were formerly used. Take such things as forced Lily of the Valley and Violets, for instance, and what can look more natural or beautiful than a combination of the two nestling on a soft bed of verdant moss in a low vessel on a drawing-room table or window recess, from which positions they would fill the air with their delicious perfume. Charming as they are when plucked or cut and put in vases in the ordinary way, they are much more so used in the above manner, as then they can be put in with their leaves and a portion of roots attached, and are able to grow away and expand their blooms almost as well as when under glass in the garden.

In forming these natural groups small seedling Ferns and many of the Selaginellas come in handy, as they are more durable than cut fronds, which in the warmth of a dry room soon shrivel up. There is one thing that should be borne in mind when cutting both these and flowers, and that is to sever them with a sharp knife, as scissors crush the sap-vessels of the stems and so prevent the absorption of water; the same thing also happens if they stand long without being retrenched, as then they become choked from coagulated matter that forms about their base. Evaporation from every pore is always going on at a rate more or less rapid, and unless they can take up fresh supplies to meet the loss, cut blooms must soon wither and die, and this is why it is that those with hard close stems are less durable than such things as *Gladiolus*, *Mignonette*, *Iris*, and other of that class that will expand in water almost as well as if allowed to

remain on the plants. It will therefore be seen how important it is that the inlets should be kept clear by timely attention in trimming, so that there may be no obstruction to the flow of moisture to replace that passing off in the atmosphere.

One reason why many flowers are so short-lived when cut is, that to get them in quickly they are sometimes subjected to more heat and confinement than is good for them, and when to this there is loss of light as occurs at this season, the petals must inevitably come thin and flimsy, in which state a dry air at once affects them unfavourably. This being the case, any plants that are being grown for the purpose of supplying cut blooms should be stood as near the glass as can be done without touching, and in such positions that they may have full benefit of all the sunshine available. So favoured, there will be little difficulty in keeping them fresh for a considerable length of time, provided the situation they occupy in the room when cut is far removed from the fire, and not where they are subjected to draughts, as they would be if placed between the door and the grate, as there is always air passing from the one to the other caused by the combustion of the fuel. Cut flowers never last so well or look better anywhere in a room than in window recesses, with the light immediately behind them, as then the delicacy of their colours is seen to advantage, and the atmosphere there is always impregnated with a greater amount of moisture on account of the temperature in that particular part being several degrees lower, as may readily be proved by testing it with a thermometer.

Such thick fleshy blooms as those of the *Camellia* may be rendered quite safe from tumbling to pieces by being wired, which should always be done before using them, otherwise they are apt to cause much disappointment by casting their petals. Four bits of very fine wire, about 6 inches long, thrust through at equal distances near the base of the flower so as to cross each other in the middle will pierce the whole, and if the ends are then brought down and twisted around the stem it will stand any amount of shaking without coming to pieces. In Covent Garden the bouquetists are adepts at this kind of work and mount almost every flower they use, but although manipulating them in that way may answer their purpose better they do not last long as their stems are so short they do not reach the water, and unless there is plenty of moss worked in it is not readily conducted to them. The duration of many single flowers may be greatly prolonged by removing the anthers, as when the pollen on these becomes ripe the stigma gets impregnated, and the purpose of Nature having been fulfilled after impregnation takes place, the petals fall, and that very quickly with such things as *Pelargoniums*, especially those of the Zonal section. The best way to treat these and all others of a like fragile nature is to let fall a drop of gum down the centre of each, which will then glue them together at the base and make them secure. In order, however, to prevent this from running out and give it time to set, the flowers should be placed in an upright position by putting their stems through the bottom of a sieve or sticking them in sand. By the use of a camel-hair brush or a sharp-pointed stick a number may be operated on in a short space of time and much disappointment saved, as nothing is more provoking just when the finishing touch is being put to a bouquet or vase, than to find some of the petals of the principal flowers are tumbling out.

It often occurs when flowers are sent from a distance, that from not being packed in air-tight cases and from being kept long on the road, they arrive in a withered condition, but if properly treated they will quickly revive, and if not bruised or injured soon regain their original freshness. Instead of being at once put into glasses of water and subjected to the dry air of a room, they should either be carefully spread out on a piece of thick wet flannel cloth, or moss, and covered with a box pressed tightly down, or put in large pans containing moss and water where they can be stood upright and shut close in the dark, where after a few hours they will be found to have filled the empty vessels and be looking as well as when cut from the plants. Especial care should be taken with cut flowers to handle them in such a manner that they are not chafed or rubbed, or they are sure to become bruised and discoloured; and more particularly is this the case with *Gardenias*, *Camellias*, *Eucharis*, and such-like things. *S. W.*

GREENHOUSE PLANTS WORTH NOTICE.

PLANTS whose habit or growth is peculiar must include *Cordyline vivipara*, syn. *Chlorophytum Sternbergianum*, that most enduring and persistent of plants—also its variegated form, which is more attractive to the eye. *Testudinaria elephantipes*—Elephant's Foot: it is most interesting to watch the first sproutings of tender green forcing its way out of the solid lump of root-stock, pieces of suitable length, if they can be spared, make, when hardened sufficiently, excellent trailers for tall glasses. *Thomasia quercifolia* is a favourite with us, with an edging of gold around the Oak-shaped leaf; although its white *Solanum*-like flower is insignificant, it stands well in water. *Rubus australis* is perfectly distinct, an inveterate hooker on to every and anything if used with cut flowers, when it lasts for very long. *Beaufortia decussata* is so regularly set with its opposite sessile leaves, squared or decussate, that it attracts when not in flower. *Coccoloba platycladon*, from its being one of these plants which bear the true leaves on dilated stems, is interesting and curious, and it is a plant that bears coming into the house, and is not easily killed. Although keeping to greenhouse plants, I cannot resist naming a most singular *Oxalis*, which bears these false leaves, so to speak. No one could guess, even when the true trefoil leaf grows at the apex, that this *O. bupleurifolia* belongs to the same family as our native Wood Sorrel. It requires a stove; as also does *O. sensitiva*, still less like a Wood Sorrel, having pinnate leaves and no trefoil leaflet at the end, closing, when touched, like the Sensitive Plant, *Mimosa pudica*, and only when its yellow flowers are to be seen would one imagine the plant to be an *Oxalis*.

Acacia seems to be one of the most varied genera of plants, and is certainly a most numerous one. You think you are sure about one fact with regard to them, and then discover there are only certain members of this erratic family that produce phyllodes, others spines, others sensitive leaves, others leaves at irregular intervals and seasons at the tip of the phyllodes; and, lastly, there is *A. pyracantha*, whose broad and silvery phyllodes have never terminal leaves (in this country at least). Three other most singular and unique *Acacias* selected at the Botanic Garden are *A. penninervis*, also broad leaved, *A. pycnantha* and *A. heterophylla*. It is barely possible to believe these are *Acacias*, unless one saw the yellow balls of flowers, which I had the good fortune to see on *A. pycnantha*, and that these broad phyllodes are not honest leaves. Neither is one much helped in believing that phyllodes are easily (?) distinguished from leaves by the fact that "they are always so placed that their edges look upwards and downwards, so that by this means, as well as by the arrangement of the veins, they may be distinguished from true leaves, which have their surfaces looking upwards and downwards." I have tried hard to find these vertical edges and horizontal surfaces, but somehow (in this country) both phyllode and leaf are looking upwards and downwards, and I would like to know the observations of those who have unlimited means and plants to study from; or is it possible that, as the plant only requires such change of position in its native climate, it accommodates itself to the present locality? It is very interesting to grow *Acacias* from seed and watch their growth, and mark when the true leaves make their appearance; it takes three and four years in some species), others, again, as the well-known *A. lophantha*, produce true leaves at once from the seed. There are above 400 *Acacias*, and of those procurable in nurseries some six or eight of utterly distinct character might be selected for the amateur's mixed greenhouse. Of this half-dozen, *A. pulchella* must be one, having spines, beautiful small foliage, which shuts up at night (a sprig in water is interesting to watch), quantity of flowers, and a small-growing species, which can be trained to suit a limited space. *A. juniperina* should be another completely distinct and characteristic in small plants.

Bryophyllum calycinum, a fleshy-leaved plant, should certainly have a place. It will do in a room, but during winter is safer in the stove. Leaves cast upon the gravel or sand in the stove-bed will make buds, and very interesting it is to see such forming at the termination of the veins at the notches on the edge of the leaves. There is quite a fringe of tiny plants in about three weeks. If the leaf is pegged down,

this result is sure at any season. The flower is purplish, and pretty I believe, but the bud-forming leaf is the interesting point of this plant.

Kleinia articulata is another singular plant, easily grown, allied to, but as unlike *Groundsel* as is the *Oxalis* already spoken of to Wood Sorrel. It makes a good basket-plant, as the glaucous gouty stems with tuft of pale green foliage at top hang about.

One other plant and I will stop. *Oldenlandia Deppeana* is always in flower. Twenty years ago Mr. Robertson, then of Lawson's Nursery, advised me to get what appeared a poor little flower, but assured me it would always be in bloom, and most true have been his words. Only three years ago did we get into a stock of it, as our present gardener found a seedling in a neighbouring pot; we now ripen any amount of seed, which germinates readily, and also, by cutting over the plants, get plenty of cuttings. Naturally it is such an incessant flowerer there are no cuttings. I daresay the seed would ripen in the greenhouse, but one pot set in the stove makes all sure. The little pure white flowers are very useful, and last long in water, and it is a very handy plant for coming into the house. I believe this last-named plant will be the most attractive to your readers, simply on account of its continual flowering. *F. J. Hope, Wardie Lodge.*

Notices of Books.

Report of the Conservator of State Forests.
Wellington. 1877.

Captain Campbell-Walker, the author of this report, was commissioned by the Government of New Zealand to draw up a report on the forests of New Zealand, their nature, the laws or customs connected with them, and on the best means to be adopted to preserve them and turn them to the best account. To this end Captain Walker traversed the greater part of the North and South islands, visiting all or nearly all the forest districts, and noting the relative abundance and quality of the timber produced in them. In his explorations Captain Walker was much aided by Mr. T. Kirk, whose local knowledge both of the country and of its botany and geology were of the greatest service. The report before us deals in detail with the several districts visited on the tour of inspection, and contains in small compass a very large amount of valuable and interesting information on the timber trees and generally on the botany of New Zealand. The first district visited was in the province of Auckland, where the reporter was "much struck by the colossal dimensions of the Kauri, *Dammara australis*, Trunks of 5 and 6 feet diameter, running up to 50 and 60 feet without a branch, were not uncommon, while those of smaller dimensions, which would be considered fine trees in other countries, were numerous. Other districts were visited in succession, and the general conclusion arrived at is "that whilst New Zealand has a splendid and most valuable property in her forests as they exist now, she must be very careful in their management, and no longer proceed blindfold in their disposal and removal, otherwise she will not only lose them without any adequate return or income to the public or colonial purse, but lose very much besides in the shape of equable climate and ample but not excessive supply of water which years of labour and heavy expenditure will hardly replace." The trees specially reported on are divided into classes according to the durability of their timber and their suitability for special purposes. The most valuable trees are thus enumerated:—1, *Dammara australis*, the Kauri; 2, *Podocarpus Totara*, the Totara; 3, *P. spicata*, the Black Pine or Matai; 4, *Libocedrus Doniana*, the Arbor-vitæ or Kawaka; 5, *L. Bidwillii*, the Cedar or Pahautea; 6, *Phyllocladus trichomanoides*, the Celery-topped Pine or Tanekaha; 7, *Dacrydium Colensoi*, the Manoa; 8, *D. Westlandicum*, the Westland Pine; 9, *D. intermedium*, the Yellow-silver Pine; 10, *Fagus Menziesii*, the Round-leaved Beech or Tawai. For special purposes other timbers are used, as *Vitex littoralis*, *Fagus fusca*, *Metrosideros tomentosa*, *M. robusta*, *M. lucida*, *Leptospermum ericoides*, *Sophora tetraptera*, *Olea aptala*, and *Eugenia Maire*. Other trees yielding timber of less durability are various species of *Dacrydium*, *Podocarpus*, *Fagus*, *Weinmannia*, *Atherosperma*, *Eleocarpus*, *Nesodaphne*, *Alectyron*, *Ixerba*, *Tetranthera*, *Knightsia*, *Hedycarya*, *Dysoxylum*, besides several others of smaller dimensions, among

which are various species of Myrtle, Fuchsia, &c. The Kauri is, however, the most valuable of all.

"The Kauri (*Dammara australis*) is the finest tree in New Zealand, and produces the most valuable timber. It is restricted to the northern part of the North island . . . It attains a height of from 120 to 160 feet and upwards; clean symmetrical trunks may be seen from 50 to 80, or even 100 feet, in length, varying from 5 to 12 feet and upwards in diameter. The timber has acquired a reputation above all other New Zealand kinds from its value for masts, spars, and other purposes of naval architecture, which, about the commencement of the present century, led to its being exported for use in the British dockyards. Except for general building purposes its use has been chiefly confined to the North island, where there is abundant evidence of its durability for more than thirty years in some of the old mission buildings at the Bay of Islands, the weather boarding of which exhibits no signs of decay. The same must be said of some of the oldest houses in the city of Auckland, and in other parts of the province, although I have been unable to obtain trustworthy evidence of their existence for more than twenty-three or twenty-four years, as in all the towns most of the old buildings have been removed to make way for improvements. Kauri has been employed, in connection with Totara (*Podocarpus Totara*), for the upper timbers of the Auckland wharf, the largest work of the kind in the colony, and with most satisfactory results. . . . The superiority of Kauri to Tasmania Blue Gum (*Eucalyptus*) under heavy wear and tear has been demonstrated by the use of both timbers on the Auckland wharf, when the former was found to last twice as long as the latter under severe tests."

The extracts above given will suffice to show the manner in which Captain Walker has treated his subject, and afford evidence of the valuable resources New Zealand has in her forests.

In addition to timber various other products, are yielded, such as Kauri gum, which is largely used instead of mastic, of which nearly 3000 tons annually are exported. Tree Ferns are exported to the value of £600 per annum, but the most curious article of exportation is a Fungus, *Hirneola polytricha*, of which we are told that in 1871 this plant was first collected for exportation to China, where it is used as an article of food, being boiled and mixed with bean curd and vermicelli; it is also administered as a medicine to purify the blood. Its price in Hong Kong is 10½d. per pound retail. In most parts of New Zealand the Chinese merchants pay the collector 3d. per pound, or £2 per ton for the Fungus when dry. Fresh specimens lose four-fifths of their weight in drying. The total quantity exported to the end of 1876 was of the value of £18,294. During the year 1876 alone, 2633 cwt. were exported, valued at £6224.

Of the particular plans recommended by Captain Walker it is needless to say much in this place, save that they appear judicious, based as they are upon personal observations in New Zealand and an extensive practice in India. The report is a valuable summary of information on New Zealand timber trees, their products, as well as the meteorology and general climatic conditions of the islands.

Annales du Jardin Botanique de Buitenzorg.
By Dr. R. H. Scheffer, Director.

The Buitenzorg garden in Java has obtained a well earned fame for the beauty of its arrangement and the extent and variety of its collections. It was established by Reinwardt in 1817, governed by the famous botanist Blume from 1822—1826, after whose departure the establishment was superintended by M. Teysmann, who in spite of crippled resources largely augmented the number of species grown. The present volume consists of a series of botanical memoirs on the plants of New Guinea, on sundry Palms, on the culture of Roses in the Archipelago, &c. M. Teysmann gives some account of his journey to New Guinea, in the course of which he mentions that the inhabitants make use of the fermented juice of Nipa when Palm wine fails, and abuse it so much that they think nothing of killing any one when under its influence. As to Roses, Teas, Noisettes, and Bourbons do best. Hybrid Perpetuals do not do so well, as a rule. Many varieties grow, but refuse to flower except on the hills. Manure is employed very abundantly, as the plants are always in growth, and have no winter rest. The rich Chinese are great Rose buyers, and do not mind paying

25 florins (Dutch) for a young plant of the green Rose! or for Marshal Niel. The volume before us is illustrated with a number of photographs of Palms, with numerous lithographic plates devoted to the botanical details of the flowers. The photographs make a plant-lover anxious to take a voyage to Batavia forthwith.

Garden Operations.

PLANT HOUSES.

ORCHIDS.—Without in any way intending to enumerate the vast number of genera, species, and varieties now met with in our houses, that for the most part are of comparatively recent introduction—many altogether new to science and culture, others, again, that have for years been known to the learned professors, but, not having been received in a living condition, all that is known of them being obtained by a study and examination of dried specimens in herbaria and botanical descriptions in old, and therefore seldom read works—whilst of others many were so exceedingly rare, and produced their flowers at even rarer intervals, that to many of those who had for years followed the culture, and ever anxious to increase in the knowledge of them, they were absolutely unknown—it may be well just now, as we pass from one period of time, as we reckon it, to another that inevitably follows, to pause, and endeavour to cast a backward glance, and to look at the very paucity of the numbers of plants in any given collection, and also to remember the small number comparatively of the species and varieties to be found in those days. Whilst thus we think of the period through which many of us have passed, let us carefully look at the situation in which we are placed at the present; notice the gain in the number of forms and varieties, the vast additions that have been made, and still are almost daily augmenting the numbers in our houses, and remember the ease with which a collection of choice varieties can now be got together, not forgetting the vast difference in the price that now has to be paid for plants of real and sterling merit, so much less than would have had to be given and were paid in the times of scarcity, and therefore of considerably greater difficulty to obtain. Take as an example the *Odontoglossums*. Twenty years ago, and even less than that, about a space of one or at most two lights on the side table of the coolest end of the Cattleya-house would be all the room required for these, and the different species then represented could almost always be reckoned up by a single figure. A single plant of *O. Pescatorei*, probably a *naevium majus*, *pulchellum*, one or two plants of *grande*, *nebulosum*, and *citrosimum*, would then have been considered a fair number to represent this genus, and if, by good fortune, a small piece of *Cervantesii* or *Insleyi* could be added to the list it was considered a matter of great success and something of which one might feel proud. Turning to the present, take any collection with any pretensions to size and comprehensiveness, and what do we find in this genus alone? Not purposing to name sorts which are or should be sufficiently well-known, it may truly be said that we have here such a rich, chaste, and attractive display, and withal in such large numbers, that to those who now have the opportunity of starting their gardening career in such a garden of Eden, the means and opportunities they possess and have at their fingers' ends should be diligently improved, and this would enable them to become proficient in the culture of these plants in a pre-eminent degree. It may be well to remind all such that there is no doubt a knowledge of the growth of plants is an ever-increasing and extending passion, and that the tendency in this is ever and always to obtain the best, most useful and beautiful, and the most serviceable in decoration, whether of rooms, or tables, or for personal adornment. And since in this class we have those that answer to this latter description, and fulfil these requirements in an especial manner, so we may be assured they will be in more increasing demand; and that those who are capable of having flowers of this order always at command, winter or summer, autumn or spring, and that too in quantity, will be the men that will ever be sought for, and deserve and obtain a higher reward for their labours; and instead of the profession being looked upon a luxury, and men sometimes being influenced by such thoughts and the spirit that follows such reflections, they will be esteemed and considered an absolute necessity, and will hold in any establishment a place of respect and trust far higher and more esteemed than many unfortunately find themselves to occupy at the present day. *W. Swan, Fallowfield.*

FLOWER GARDEN, ETC.

Although the present year is now drawing to a close the work to be carried on in the garden is never

all finished, but something constantly wants doing, and we must always be looking forward to something which we can improve and try to do better than we have hitherto done. Therefore we must not rest satisfied with what we have accomplished, but aim at higher and more favourable results. Proceed with the work which is best suited to the state of the weather and other circumstances. Should sharp frost set in take advantage of the opportunity for wheeling manure on all vacant pieces of ground while the winks are hard; this work is much more expeditiously done than at any other time. Soils may be got ready for potting, which will save time when the busy season comes round. In open weather digging, trenching, and cleaning-up generally may be carried on. The grass will also require frequent sweeping and rolling, in order to keep clean and smooth. In stormy weather see that climbing plants in exposed positions are secure, those trained on walls or trellises nailed or tied, and others that may have broken from their supports have fresh stakes, to prevent them from being damaged. During intervals of unfavourable weather, when outdoor work cannot be carried on to advantage, something will always require looking to. Where plants are kept under glass have them carefully gone over, and all dead pieces cut off, decayed leaves removed, the surface of the soil stirred, and many other matters may be attended to which are apt to be overlooked when the time is more favourable for other operations. Give no more water to bedding plants in cold weather than is absolutely necessary, but when the temperature ranges higher advantage should be taken of the first suitable opportunity to give them a good supply, which probably may be sufficient for them for several weeks. Where a large number of plants are used for bedding purposes, and with the view to introduce more variety, which is not so often met with in the modern style of flower gardening, a very pleasing effect might be made by planting some of the beautiful varieties of perennial Phloxes, Pentstemons, Delphiniums, &c., and with several of the more lasting hardy annuals a most interesting and enjoyable display may be made on borders by the sides of walks and other places: such borders would be found most useful for cutting from during the summer and autumn months, and would be of great service where flowers are used largely for bouquets and for table decoration. *T. Blair, Shrubland Park.*

FRUIT HOUSES.

CUCUMBERS.—One of the most trying and disappointing years to horticulturists, now waning, seems likely to go out in the good old English fashion, for at the present time the ground is covered with a thin layer of snow, and the thermometer last night descended to 20°. This sudden change from a long period of dull mild weather will necessitate a little extra firing to prevent the plants from receiving a sudden check, one of the worst accidents that can befall winter Cucumbers at Christmas. To counteract sudden depression, economise fuel and save the plants from injury by hard firing. Blinds or mats should be placed over the roof at nightfall and during snowstorms, but the covering must not be allowed to remain on longer than is absolutely necessary, as Cucumbers require all the light that we can give to them in Winter. Whilst guarding against sudden changes of temperature avoid exciting the plants overmuch by going to the opposite extreme. A minimum of 68°, with a rise of 10° to 15° by day from sun and fire-heat combined will be sufficient until the days get longer and brighter. Pay constant attention to top-dressing with rough sods as the roots show through, and apply clear tepid liquid. Crop lightly and cut the fruit young. Watch closely for red-spider, which generally follows sharp firing: the remedies are well known. If the plants are syringed once a week with a weak solution of Gishurst, ½ oz. to a gallon of water, spider may be held in check. In badly ventilated pits subject to canker this troublesome disorder may now be expected. The best remedy is good quicklime well rubbed into the parts affected. *W. Coleman.*

THE Fine Arts department in the city of PARIS has under consideration a plan for adorning the promenades and open spaces, down to the smallest squares, in a way similar to what has been done in parts of the Parc Monceau. According to *Galignani*, the idea is to place, at certain distances, busts of all the historians who have left studies of the manners and customs of the capital, in the great avenues—such as the Champs-Elysées, the Avenue du Bois de Boulogne, &c. In the squares will be erected statues of notable personages, provosts of the guilds, judges, soldiers, &c., of all periods, who have in any way conferred lustre on Paris. Finally, in the large spaces, such as the Bois de Boulogne, the Buttes-Chaumont, and Montsouris, groups will reproduce historical events which have occurred in the city from the most distant times to our days.

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 29, 1877.

FOLLOWING a practice which has now become customary, we turn over the record of the year, now at its close, and proceed to glean from the mingled statements what there may be which will in the future render the year memorable—or what there has been in it that is deserving of more than ephemeral notice. Taking in this way a general survey from a distance as it were, we see things in better perspective, and can form a juster estimate of their proper proportions than we could do at the time in the hurry and confusion amid which work has to be done now-a-days.

Wholesome activity rather than startling advance seems to have characterised the horticulture of the year; falling back there has been none; of steady onward progress, more perceptible in the future perhaps, there has been much.

In scientific horticulture the two main events of the year are the establishment of a physiological laboratory at Kew, and the publication of Mr. DARWIN'S work on the *Fertilisation of Plants*. The laboratory has, we believe, already been utilised by Professor TYNDALL, in his experiments on germs, by Dr. BURDON SANDERSON, and others; and we would fain hope that in the future the foundations of improved practice in horticulture may be laid in the accurate study of plant-life, and the conditions favouring it in the laboratory at Kew. The garden and the herbarium have each in their respective ways been of incalculable service to horticulture and agriculture. There is urgent need for physiology—the study of the living plant in action—to be prosecuted, as we hope it will be, till the newly-opened laboratory shall take its place by the side of the herbarium as a great centre of scientific discovery, and a means of diffusing information for the common good. Mr. DARWIN'S book, whatever modification may hereafter have to be made in the inferences drawn from it, must of necessity form the basis for much of the work of the future. Hybridists, propagators, and raisers of seedlings will in time consciously or unconsciously mould their procedures on the results obtained by Mr. DARWIN.

Practical horticulture, so far as it can be estimated in a general way, without going into detail, may be roughly gauged by reference to the various horticultural exhibitions of the year. If numbers be a test of merit or progress, then practical horticulture must be very flourishing. Exhibitions increase on all sides, and if they are not always called for by any real exigencies of horticulture, at least they evince an increasing love of flowers among the populace. So far as gardeners themselves are concerned, we strongly doubt the good effects of these ever-increasing shows.

Leaving that topic, however, as one not suited for discussion on the present occasion, we may say that the general average of merit in plants exhibited has been high. The shows of the Royal Horticultural Society have throughout the year been excellent, the fortnightly and monthly committee meetings have been kept up with spirit, and have been of the most interesting character, though neither the South Kensingtonians nor the general public seemed at all to appreciate the treasures prepared for their delectation. When HER MAJESTY on one occasion, and the Prince of WALES on another, visited the gardens, there was indeed a large influx of visitors, but they came to see the QUEEN or the Prince,

and the flowers and fruit were less than secondary considerations. As to the Society, the supposed national exponent of British horticulture, it has not done much to act up to its duties—as much, perhaps, as could be expected under present circumstances. Its finances are, we believe, somewhat better, and there have been a few new members added, but we look in vain for any indications of a real appreciation of the gravity of the situation and of the necessity of reconstructing and reorganising the Society. The proposed appointment, however, of a paid secretary, conversant with scientific horticulture, is a step in the right direction, and we only trust that the scandalous jobbery which dictated a former appointment of the kind may be present to the minds of the electors on this occasion, and induce them to make a proper selection. Of foreign and provincial exhibitions, we can only say that neither that at Amsterdam nor that at Carlisle were up to the usual standard of such important exhibitions. The Carlisle show was also singularly unfortunate in the weather.

To the weather also must be attributed a fruit crop worse probably than has ever been experienced before, except, perhaps, so far as Nuts and small fruits are concerned. The Potato crop was not much better, though, perhaps, hardly so bad as was at one time anticipated.

The Colorado beetle has not yet made its appearance among us, but when he does come we shall at least be in a position to cope with him; and so much has been done in the way of making his lineaments known to those whom they concern, that we may hope not to have so many boxes of ladybirds sent to us in future under the impression that they were the dreaded foes.

Seed killing and seed dyeing have unfortunately made their appearance again, but we have little doubt that the unprincipled manipulators of such wares will speedily find that the game is not worth the candle, and turn their attention to some other less risky business.

The obituary list of the year is perhaps less heavy than usual, and contains fewer distinguished names; nevertheless, we count among our losses the names of ALEXANDER BRAUN, the noted botanist of Berlin; of HUGH WEDDELL, of ALFRED SMEE, so well known as an enthusiastic horticulturist and a keen man of science; and of THOMAS RIVERS, whose great achievements and fine character formed so lately the subject of comments in our pages.

It is a sad thing to wind up the year with, but our duty as chroniclers compels us to notice the disastrous fire at the establishment of Messrs. WEEKS & Co., the eminent horticultural builders, and the lamentable destruction of new plants in the adjoining establishment of Mr. BULL. Happily no loss of human life is reported, but the destruction of many fine plants is a matter which will cause all plant lovers to sympathise with Mr. BULL, whose energy in collecting them together has been so remarkable. Fortunately, though the loss is great, there are still many left to replace those destroyed. *Le roi est mort—vive le roi!* Regrets are unavailing. On the whole we horticulturists have deep reason to be thankful, and good grounds for anticipating that 1878 will be a year of progress. Let us all resolve that the fault shall not be ours if it prove otherwise.

THE following statement has been sent to us for publication by the Council of the ROYAL HORTICULTURAL SOCIETY:—

"The Council submit to Fellows and members the following statement:—

"The end of 1876 found the Fellows, as a body, dissatisfied with their privileges and divided into hostile sections, their resignations alarmingly numerous, and new candidates for the fellowship few; the Council, unable to satisfy the conflicting wishes of the contending parties, obliged to maintain South Kensington Gardens,

and without funds in possession or prospect sufficient to carry on the Society with credit to the end of the year 1877. In this situation all parties saw the necessity for mutual concessions, and the Society ceased to be torn by internal strife. The privileges claimed by Fellows were granted to them and added to, and a new body of annual members created. Resignations ceased, and candidates for admission presented themselves in numbers which, though absolutely large, are still far short of those required to place the Society on a safe footing for the future.

"The fortnightly fruit and floral meetings were held in the conservatory, and through the admirable exertions of the exhibitors assumed the beauty and dimensions of regular shows; and the Saturday promenades were resumed, although much later in the season than the Council could have wished. In addition to the fortnightly exhibitions, a special show of Covent Garden produce proved most attractive; and two magnificent summer shows held in the Gardens were honoured respectively by the presence of the QUEEN and the Prince and Princess of WALES.

"During the year the scientific and practical work of the Society has been satisfactorily prosecuted at the Chiswick Gardens, from which also plants, cuttings and seeds have been largely distributed among the Fellows. 779 debutante holders have accepted Fellows' privileges (except that of voting) in lieu of interest on their debentures, and the Council believe it will be possible to make a similar arrangement on a more extended scale for 1878. All the expenses of the Society for the year have been paid up to date and out of revenue.

"Next year, during March, April and May, the fortnightly exhibitions will be held in the conservatory. On these occasions a band will attend. In June a four days' show, which the Council hope will at least equal any ever seen in London, will be held in the Gardens. In July a four days' provincial show on a large scale will be held, under the patronage of the Society, at Preston; the funds for this purpose being raised by guarantee. Any surplus from this show will be vested in trustees, for the promotion of similar shows, which experience has shown powerfully stimulate practical horticulture. The Council hope to resume the publication of the *Journal* of the Society on a suitable footing, and to make satisfactory arrangements with correspondents in foreign countries for the collection and transmission to England of rare seeds and plants.

"The Council desire to render the South Kensington Gardens attractive to London Fellows and members, and with this object will provide a band and give promenades every Saturday while the attendance justifies the outlay. These promenades will commence on Saturday, January 19, will, during the winter, last from 3 to 5 P.M., and be held in the conservatory, which will be warmed, and when necessary lighted at dusk; Fellows' tickets and small book orders will admit to them; and, to render them select, the minimum charge to the public will be half-a-crown. Members will have personal admission. From wishes expressed at general meetings and otherwise conveyed to them, the Council believe that a summer *fête*, to be held in the evening, would yield gratification to many of the Fellows, and they will give the subject their consideration. Fellows' privileges will remain as settled this year. Lists of these and of the promenades, exhibitions, and shows for 1878 will be sent to each Fellow and member in due course.

"Although the position of the Society has improved to an extent that could scarcely have been anticipated at the beginning of this year, the Council must remind Fellows and members, especially those resident in London, that the aggregate amount of their annual subscriptions is still far short of the £10,000 which must be raised from that source during the next twelve months, to prevent the forfeiture of the South Kensington Gardens. The money must come from the subscriptions of Fellows and other annual subscribers; if not so raised the gardens will be forfeited, and perhaps built over; if so raised, they will be secured to the Society for fifteen years. The Council believe that if Fellows and members exert themselves individually to induce their friends to join the Society, the amount required, which exceeds the average income from subscriptions in the years 1871 to 1874 inclusive by less than £2000, can easily be obtained. If the gardens are to be preserved this effort must be made at once."

— We much regret to state that Messrs. J. WEEKS & Co.'s extensive premises in Maude Grove, King's Road, Chelsea, were totally destroyed by fire on Sunday morning last. The fire broke out about 10.30 a.m., and steamers from Brompton, Kensington, Bayswater, Portland Road, and King Street, Regent Street, were quickly summoned to the scene, but in spite of the exertions of the firemen the whole range of premises were soon alight, and about an hour after the outbreak the roof fell in with a loud crash on to the valuable machinery underneath, and

Home Correspondence.

Lapageria alba.—The remarkable floriferousness of this plant has been well exemplified the past season in the Camellia-house of Mr. C. W. Cowan, of Valleyfield, Pennicuick. It produced not only several hundred flowers, but there were about 400 fully expanded delicate wax-like blooms adorning the plant at one time. This appears to have been one of the very earliest introduced plants, having found its way here, I understand, from the Exeter Nurseries when it was exceedingly rare. It is growing on a trellis facing the glass in the tall perpendicular front of the Camellia-house, and is planted out in a slate tub. No such plant for general excellence has come under my eye, not even the famous Trencham plant, although the latter is larger; this one seems reveling under the cool winter treatment common to all well-managed Camellia-houses. Indeed, the Camellias themselves, particularly *alba-plena* and *imbricata*, are equally notable for good culture, being great cylindrical masses of foliage quite 12 feet high, and about 4 feet in diameter, grown in strong hooped circular tubs. These things particularly reflect considerable credit on Mr. Burd, who hailed from the sound practical teaching of Mr. James M'Nab to this place some thirty years ago. A.

Pinus insignis.—Seeing Mr. Penford's remarks at p. 724, I was induced to measure a specimen here that was planted in April, 1869. When planted the tree in question was turned out of a pot, and had a leader and four lateral shoots, and was 2½ feet high. The height now is 21 feet, girth of the bole at 1 foot from the ground 2 feet 3 inches, circumference of the branches 42 feet. Fine specimens of *Abies Douglasii* and *Cupressus Lawsoniana* are now 21 feet high. *Arbutus Unedo*, turned out of 4-inch pots in 1868, are now 10 and 12 feet high, with fine heads on them, covered with flowers and fruit. In planting the trees and shrubs here the ground was trenched, keeping the good soil at the top, and forking up the subsoil. The growth of the plants has well repaid the labour. *W. Hutchison, Llwyndii Court.*

Poinsettia pulcherrima.—At this dull season no flower can surpass the dazzling effect produced by a well-grown lot of Poinsettias, such as are now in flower at Old Saeed Park. A large quantity were struck in July and August, and grown on in large 60-pots, the most convenient size for house decoration; and the plant so confined makes but little growth, therefore the result is a dwarf plant with a grand head of bracts, suitable for any purpose. My plants vary in height from 6 to 18 inches, with bracts varying in diameter from 10 to 18 inches. Many larger specimens are also grown with bracts measuring fully 23 inches in diameter, which is thought here to be especially good. I should like to have the opinion of Poinsettia growers as to what size they have been grown. *E. M.*

Dendrobium chrysanthum.—This popular Orchid, so long known and appreciated, bids fair to rival even the most wayward of the species of this family for diversity, both in point of habit and inflorescence. The exceeding richness of the flowers, remarkable alike for depth of colour and great substance, stamp this as one of the most suitable for cultivation in a general collection. Usually it is of somewhat pendulous habit, throwing its pseudobulbs somewhat in arching fashion from the centre of growth. Unlike its compeer *D. nobile* it flowers from the maturing, not from the matured growth, and although it may be comparatively mismanaged, so as to yield only a few flowers at the extremity, in good hands any variety will flower half-way down the growths. What induces me to speak of it now is the coming in contact with a very superb variety in the choice well-managed collection of Mr. Wm. B. Boyd, of Ormiston House, Kelso. This variety had actually the very large number of ninety-eight flowers on a single growth, that growth being from 4 to 5 feet long!—quite the height of a stout well-grown Wheat-stalk! Great as is the variety in *D. Wardianum*, as Professor Reichenbach truly says, this *chrysanthum*, in the remarkable instance quoted, seems quite to outvie it. The pseudobulbs were so long that Mr. Fairbairn, who is no novice in Orchid-growing, as the writer had occasion to remember in his examples at the International Show of 1866, had to tie it up perpendicularly. The variety appeared to me to be so remarkable that a simple notice of it for present comparison and future reference, would, I opine, be interesting to your rapidly increasing list of Orchidophilists. *James Anderson.*

The Magnum Bonum Potato.—Although there is an undoubted similarity between the tubers of *Magnum Bonum* and *White Belgian Kidneys*, the haulm is so different that there is no reason for any grower continuing to cultivate the latter variety under

the name of the former if he has once grown both kinds. The haulm of *Magnum Bonum*, where grown on good soil, reaches to a height of 30 inches, is very woody and erect, and has medium-sized rough leaves, indeed it resembles the well-known top growth of *Victoria* more than any other kind. The haulm of *Belgian Kidney* reaches to an average height of 18 inches, is of more compact habit; the foliage generally resembles that of *Bressee's Prolific*, the leaves being green and glossy, but the growth of the plant is more erect. Even by the slicing of the tubers I have been enabled to detect the different sorts, as the flesh of the *Belgian Kidney* has a yellow tinge and is rather coarse and watery; the skin also has a pink tinge. *Magnum Bonum* has flesh of solid and fine quality, whiter than that of the preceding kind, and displaying the smallest quantity of moisture on the surface. I have this day enjoyed a singular experience, having had a dish of *Magnum Bonum* cooked from lots grown here in clay loam, in Wilts in black sandy loam, and in Berks on gravel, but the diversity of soils gave no divergence in the quality of the Potatos when cooked, all the tubers being then exactly alike. I am inclined to think that very few, if any, of the *Belgian Kidney* have been sold for *Magnum Bonum*, as in a varied Potato experience I have not seen other but the real kind growing under that name. Seed houses, as a rule, don't do that sort of business, for even if inclined to be dishonest, by no means (in spite of recent revelations) a feature of the trade, it would soon provoke more loss than gain; no seed house can continue to trade long on the credulity of its customers. It may answer a certain purpose to start stories of this kind, as was the case with another somewhat popular Potato a couple of years since, but they won't bear inquiry. *Magnum Bonum* is a fine main crop Potato, and merits all that has been said in its favour this season, which has peculiarly suited it. *A. D.*

Root-pruning v. Finger-and-thumb Pruning.—I think finger-and-thumb pruning is of little use in the case of trees outside if the roots are in a cold subsoil, the result of the practice being a second or third growth of wood, and but few fruit-buds. There is a fine wall of Pear trees here, which quite fill the space allotted to them, and I think they are about twenty-six years old from the graft. The breast-wood on these trees last summer was fully a yard long, and there has been hardly any bloom on them for the two years I have had charge of them. I recently set to work to root-prune them. We opened a trench about 6 feet from the stem, and gradually worked up the roots till we got under the stems, where we found in nearly every case a number of strong roots going straight down into the clay and under the wall, and many thong-like roots so full of sap that they snapped like a carrot on being slightly bent. Finger-pruning in this case would be useless. [Certainly.] The roots were laid in near the surface in good turfy loam, and though the remedy, from the size of the trees, is a severe one, I have no fear for the result. *Fahn Barker, Sandown Hall, Liverpool.*

The Rival Ivies.—It is not at all clear what Mr. Thomas Williams really does mean. He told us in his first letter that the demand for Irish Ivy was so great that nurserymen could with difficulty keep pace with it, and now he says that he did not mean that there was any difficulty. According to his own showing it is in demand, and has been for years, and so are all Ivies, and their great usefulness makes them more and more in request. Does he mean to say that the gardening public (who, by the way, are very fair judges of what suits their particular requirements) have been for such a length of time purchasing an article that now turns out to be such a scarecrow as he describes it, when a much better thing was to be got quite readily? He praised the extreme leafy constancy of character of his native Ivy in his former letter, and now he admits that it varies. He will probably tell us in his next that he has discovered that, after all, the Irish Ivy known to him is only a selected form of the English, preserved in its constancy, as all other varieties can be, by constant propagation by cuttings. As to the Ivy being shorn like a sheep, most practical men admit that, a work once performed is done with; and so when Ivy is cut in the spring, and the litter cleared up, the constant mess that uncut Ivy makes all through the summer is obviated. If Mr. Williams will try what we in this more practical country adopt, he will not require to have a man up a break-neck ladder for days together. A handy man with a short, sharp, strong reaping-hook will go over as much ground in one hour as another will do in a day with a pair of ordinary shears. This not only applies to shearing Ivy, but to all other shearing—hedges, &c. *T. Smith.*

The Destruction of Mealy-bug.—At p. 693 "Experience" informs your readers that the present is the most appropriate season for the annihilation of this abominable pest, and the most inexperienced of

us will endorse what your correspondent has written on the subject. I have had to contend with it, and know well what a terrible pest it is to eradicate when Vines or plants get overrun with it, and the most effectual remedy with which I am acquainted by personal experience is Bridgeford's Antiseptic Liquid. Merely touching the bug with it, with a sponge or small brush, causes instantaneous death. When a statement like this was made to me by a nobleman's gardener, under whom I acted as foreman, I had much hesitation in believing it, but my master soon convinced me that he had not exaggerated its destructive qualities. Since I have had the management of these gardens this liquid has been used, with the same good results, without the least injury to our plants. My only object in giving this matter publicity is that I have proved it to be truly a boon, and that there may be some who may not know of its existence. I have no hesitation in asserting that any person who will give it a fair trial will fully bear out what I have written about this invaluable liquid. I think Mr. Bridgeford's (seedsman) address is Sackville Street, Dublin. *Thomas Lloyd, Gr., Mongevell Park, Wallingford, Berks.*

I can justly endorse all that "Experience" said regarding cleanliness. It is a difficult task to deal with mealy-bug in a mixed collection, but it can be kept under. I say with "Experience," get out of it and keep out of it; but how we are to prevent it coming from the nurseries is another question. It is not always convenient for gardeners to go to pick their own plants, and it happens sometimes that our employers take a fancy to a rare plant, and order a hamper to be packed, and it very often happens that they pack some bugs as well, and it is always the busiest season when these plants arrive. I had on our old Vines a good stock to start with four years ago, but during the following spring I peeled all the bark off and dressed with paraffin oil. The Vines broke weak and showed only small bunches, but there was no bug during that or the following spring to grumble about. The winter following I did not attempt to disturb the bark, and in the spring following the bug was as bad as ever: so I have taken the bark off again, and dressed with the Chelsea Blight Composition, mixed with clay, applied as a thick paint. I have heard that paraffin has caused the death of some Vines, but, though I gave these Vines two dressings in one day, it has weakened the growth and reduced the crops to half but not killed any. *H. W. D. H.*

"Experience" gives some very useful hints at p. 693 on cradicating this pest, but, next to prevention, there is no remedy at once so simple, cheap, and effectual as the cold-water cure. The moment a bug is seen direct a powerful stream of cold water against it. This batters the woolly-looking filaments to atoms, and the pest denuded of these is well nigh powerless for further mischief. If not much injured the bugs seem to have sufficient strength to recover, but three good shots in succession from the end of an engine or well-handled syringe will finish the strongest bug alive or render him powerless for mischief in the future. There is nothing bothers these pests like a powerful shower-bath. The coldness of the water also seems an element in the cure, the water denudes them of their filaments, its force also bruises them, and the cold striking them on the heels of both, probably produces paralysis or death. Certain it is the persistent use of cold water clears off the most inveterate cases, and has been quite effectual in keeping large masses of *Stephanotis*, as roof climbers, clean. Of course some care would be needful in applying this cure to tender leaves or shoots, such as Vines or other plants, but most stove plants will bear a dash of cold water with impunity. We have seen hot water up to a temperature of 140° tried with less decisive effects. This and experiments with water from 140° down to the coldest that can be had in a shady place in the open air in summer, shows that the colder the water the more speedy the cure. It may be needful, however, to add that by this statement it must not be inferred that iced water is meant, or water from the open air, for stove plants after November; at no season should water under 40° or 45° be used, and in summer, of course, our cold water is at least 10° warmer than that; so that the term "cold" is a mild and relative one after all. The force of the water and the disparity of temperature between it and the pests seem the chief elements of success in the cold-water cure. If at first it don't succeed, all that is needful is to obey the nursery rhyme and "try, try, try again" until it does. *F.*

Rubus laciniatus.—A great deal has been written in favour of Vegetable Marrows for making preserves, and those who use the recipe given in the *Gardeners' Chronicle* may like to know of a cheap addition to the valuable fruits for making preserves. The plant is *Rubus laciniatus*; it is much the same as the common Bramble, but the berries are larger and earlier, and a more abundant crop of them is produced. This season the common Bramble failed entirely to ripen; we began to gather the other for ordinary domestic purposes as soon as our small fruits failed in the

garden, and we found it an excellent substitute. All who have a rubbish heap, or any unsightly object to cover, where it is practicable, I would recommend to plant of the above; it is a robust grower, has beautiful foliage, and altogether it is a most suitable, as well as profitable plant for such purposes. *W.*

Temperature of Outside Early Vine Borders.

—I think "S. W." is scarcely correct in saying that "In starting an earlyinery, and for some time afterwards, the heat of the house, and that of the border outside, bear the same relative proportion to the natural ground and open air during the spring." The mean temperature of the ground in April at a foot depth is 45°. I find the mean temperature at Edinburgh in the open air for the same month is 45°. In starting ainery in December the ground temperature is by the same tables 34°.6. The mean temperature at Edinburgh in open air for December is 39°.8. (I have taken the mean open-air temperatures for Edinburgh, as they are ready to hand, and may be taken as an average for Scotland.) This shows that in spring the relative temperature enjoyed by root and branch is much the same. But if we create an artificial temperature round a Vine by starting it in December in ainery while the roots are all outside, it appears to me there will not be "much relative proportion to the natural ground and open air during the spring" unless some means are taken to raise the temperature of the border. The pinch is most likely to be felt not so much at the starting as from the time the bunches show till they begin to colour. "S. W." also asks me how I "account for the rapid start vegetation makes after a few hot days and a genial shower or two?" Why nothing is more simple, because those hot days act upon the soil and the roots at the same time as upon the stem and branch above ground, and the genial shower or two, if there is enough of it after refreshing the top, finds its way to the roots. The mistake "S. W." makes here is in recommending that when Vines are started in December the stem and branch should have the necessary artificial climate inside theinery, corresponding to those warm days and genial showers in spring, while the roots are outside starving perhaps in a temperature a little above freezing, and entirely shut out from the vivifying influence of heat. In reply to the query as to the "North of Europe, where they jump at once from winter to summer—and what about the warmth of the soil there and its effect in producing root-action, and is it not rather brought about in response to atmospheric influence alone?"—I may say that I have no figures at hand showing the air and soil temperatures for those parts in the North of Europe where summer comes so suddenly, but I should say that it was scarcely a climate for Vines flourishing outside; it only affords additional proof, however, that Nature gives the soil and roots the benefit of a summer climate at the same time that the part of the plant above-ground is exposed to its influence. It is a fact well known to meteorologists that the daily range of temperature influences the soil to depths varying from 2 to 3 feet, according to its nature; friable soils feel its influence to a greater depth than cold clay soils. In my own experience the underground temperatures registered here often vary from 2° to 4° at a depth of 2 feet in the space of twenty-four hours during a sudden change from hot to cold, or the reverse. Without going into all "G.'s" communication last week, I may be allowed to notice one or two points in it. In reply to "S. W. the Second's" query for the temperatures of his borders, or the weekly means of the borders when forced without artificial heat he tells us he has not been at the trouble to ascertain; that he took two observations, and found there was no perceptible difference, at 18 inches deep, between a border covered with fermenting material and one simply covered with leaves, "and that the question is not of much importance." Surely, if he wants to show the fallacy of a practice adopted for generations to assist in the production of early Grapes, it is worth the trouble to have more than two observations to show that heating an outside border is unnecessary, and if cultivators run the risk of losing a crop by following his advice, surely it is a question of some importance. From his experiment of 1861-62 he feels thoroughly convinced that, whatever amount of heating material be placed upon the border, it is impossible to drive the heat far down into it, and unless it can be driven down more than a foot or 18 inches he cannot see that we are "gaining anything by placing it there." As he is already thoroughly convinced it would be labour lost to try to convince him, it would perhaps be a more hopeless case than *Punch's* typical Scotchman who at least was "open to conviction, but would like to see the man that would convince him." I have never heard of any process by which heat could be "driven" into the earth, nor is there any necessity for any driving process, because when the air is warmer than the earth then the earth absorbs heat from it; when the air is colder than the earth, then the earth loses or gives back heat to the air. In

the early part of the season up to July, the earth on the whole gains more during the daily ranges than it loses. After the maximum is reached at that time, then with the shortening day and longer night the earth gives out on the whole more than it gains, hence the gradual diminution of the mean temperature until the minimum is reached in December. By putting heating materials on a Vine border the earth simply absorbs the heated air, and if carefully managed a gradual rise of temperature in the border is secured instead of a gradual loss during the winter months. "G." finishes with the remark that "unless your correspondents can prove that they can grow better Grapes, &c." with than without "heat to outside borders that he has the best of the argument." As "G." says there is no necessity for a practice that has been in general use many years, and is still, the onus of proof lies with him. About having the "best of the argument," he is welcome to his own opinion about that, so long as both sides of the question are properly ventilated. *D. M., Dunrobin.*

The Weather.—Last year I ventured to remark that where the wind was on Martinmas eve, November 12, there it would be for most of the winter, and nothing could be more true than that it proved last year. It appears we are going to have another mild winter, the wind being south-south-east on November 12. It has shifted to the east for a day or so, and also to the other points, but it very soon veers back to the south and is now as I am writing. My old garden woman says it will be there most of the season, for she and her old man have noticed that it has been so for fifty years. [Keen observers!] *W. Brown, Merewale.*

A Rat-guard.—To keep rats away from anything that is hung up, the following simple method may be used. Procure the bottoms of some old fruit cans, by melting the solder which holds them upon a hot stove. Bore holes in the centre of these discs, and string a

FIG. 162.—GUARD AGAINST RATS.

few of them upon the cord, wire, or rope upon which the articles are hung. When a rat or mouse attempts to pass upon the rope by climbing over the tin discs they turn and throw the animal upon the floor. This plan, shown in the illustration (fig. 162), will be found very effective. *American Agriculturist.*

Early versus Late Propagation of Chrysanthemums.—I can assure Mr. Hinds that what I have said in favour of early propagation of this plant was not based upon supposition, but on actual practice. Though I have never grown this flower for exhibition, but in common with other decorative plants which I have cultivated, I have always tried to do them as well as if they had been intended for that purpose. I have tried the effect of propagation from December to April, and have found the earliest time the best. Mr. Hinds commits a common mistake in arguing that certain conclusions must result from a particular practice, basing their argument simply upon theory, than which nothing is more delusive. No one who knows anything about Chrysanthemum culture needs to be told that the suckers should be kept cleared off until the flower-buds are well advanced; but I always reserved one plant of a kind on which the suckers were not removed from the time the buds were fully set, and these will be large enough for putting in by the time the flowers fade. The Chrysanthemum is a hardy plant, and requires no warmth to induce the cuttings to strike further than, as I said, a greenhouse or ainery at rest. Here the cuttings will root, during which time they will make very little top-growth; after which, the propagating-glasses being totally removed, and the young plants allowed to remain for two or three weeks in the cutting-pot, require no confining after potting off singly, and should be kept quite cool with plenty of air. So treated, the 2½ or 3-inch pots into which they were moved will not be overcrowded with roots before April. Mr. Hinds says these winter-struck plants will not retain their bottom foliage healthy through the season. Most certainly they will, if they receive all they require. I stop my plants 6 inches from the collar, and they invariably retain all the leaves above that; and as, with the liberal treatment I recommended,

the leaves grow to a size that enables the lowest to all but touch the soil, there is no naked stem seen. Chrysanthemums will thus retain their leaves to the end of the season, provided they are properly treated, taking special care to keep them free from aphides and mildew, and never letting them want for water well enriched with manure. I found no difficulty in growing late-struck plants quite as large as those propagated earlier, but the early ones under similar subsequent management were always able to perfect a larger number of flowers. The time of commencing, like every other operation connected with the cultivation of a plant, requires to be regulated by, and is part and parcel of, the whole routine of culture through the year. And as in a Calendar this could not be given all at once, consequently the suggestions for any single week are scarcely a fair field for criticism. It is like finding fault with unfinished work. *T. Baines.*

Plants in Flower at Clevelands, Dawlish, on Dec. 25.—I send you a list of what there is in bloom in my garden to-day. I live on a hill quite close to the sea, and am very much exposed to east winds:—Wallflowers, Stocks, Carnations (seedling), Violets Prince Consort, La Belle Chatenay, Czar; Laurustinus, Mignonette, Jasmin nudiflorum, Veronica, Arbutus, Daphne cneorum, Chrysanthemums, Lobelia, Anemones (single and double), Cytisus racemosus, Roses Alfred Colomb, La France, Gloire de Dijon; Periwinkle, Primroses, and, I regret to say, Charlock and Coltsfoot. I have to-day eaten Raspberries and Blackberries. In respect to Orchids I have *Odontoglossum grande* still in flower, and one plant yet to open, with five flowers on the spike. This Orchid has been flowering with me since June 30. An unhealthy plant of *Cypripedium venustum* has two flower-spikes out of the same young growth, which is an unusual circumstance, and I fancy foretells its death. *Edward W. Walker, Clevelands, Dawlish.*

New Plants Certificated.—In your list of these, given on p. 778, there is one omission, namely, that of *Primula veris robusta alba*, which received a First-class Certificate when exhibited by me on April 18. Permit me also to state that *Viola Golden Prince* came from M. Fromow, and *Viola Vestal* from myself. *Richard Dean, Ealing, W.* [The list was drawn up from our own notes, the official list having been refused. *Eds.*]

The Gravenstein Apple.—I can tell Mr. Rust why I have not planted the Gravenstein Apple extensively. It undoubtedly is, as he says, a first-rate Apple early in the autumn, but here it is an unhealthy tree, liable to canker, and a very shy bearer. This latter quality alone will prevent its ever being extensively cultivated. *C. W. Strickland.*

Christmas Decorations.—In your article upon evergreens for this purpose you omit to notice the several kinds of evergreen Barberry, many of which, besides being evergreen, supply us with some of the brightest colours to be had at this season. Nothing can be more brilliant than the scarlet leaves which are frequently scattered about the sprays of *Berberis Darwinii*, and the leaves of *B. Aquifolium* furnish us with every sort of variety of crimson and puce and purple. *C. W. Strickland.*

Reports of Societies.

Edinburgh Botanical.—The Society met on the 13th inst., Dr. Cleghorn in the chair. The following communications were read:—

1. *Description of Hieracium Dewari*, a new species, by Dr. J. T. Boswell. Dr. Boswell furnished a detailed description (on the plan adopted by him in *English Botany*) of this novelty, which he has been unable to identify with any described species, and had named it after the late Dr. A. Dewar, of Dunfermline, to whose exploration of the botany of Clackmannan, Kinross, South Perth, and West Fife, we are much indebted. Few local botanists appear to have worked their district better. Previous to 1875, when Mr. T. Drummond distributed it as "*H. strictum*, broad-leaved form," most of the specimens in the British Herbaria were of Dr. Dewar's collecting at Linnmill and the Ochils, though there is no doubt that the plant was first collected in the Loch Lomond district by Professor Balfour. The British or reputed British species of *Hieracium*, to which *H. Dewari* is most nearly allied, are *H. juranum*, Fries (Borreri of *E. B.*, ed. iii.), and *H. gothicum*, Fries. No doubt it sometimes presents a superficial resemblance to *H.*

strictum, Fries, but their physiological characters are widely different. (Specimens were exhibited).

2. *Notes on the Flora of the Neighbourhood of Blantyre, Shire Highlands, Central Africa*, by Mr. John Buchanan, in a letter to Professor Balfour, dated August 6, 1877, read by Mr. Sadler.—The timber here, as in many places among the Shire Hills, is, as a rule, inferior. Beside streams and in damp places some good trees are to be seen. In appearance the trunks resemble much the Plane tree at home. Except in such places it is rare to meet a tree of more than a foot in diameter. What we have found the most useful for house-building and other purposes is a fruit tree called Lisuka. The wood is red and hard, and has the advantage of not being soon attacked by insects; the fruit is of a brown colour, about the size of a Plum, and much eaten by the natives. It agrees well with its order, Santalaceæ, and is very plentiful. A wood with a dark, hard centre and yellow albumen is also plentiful. I have not seen it in flower. The leaves are pinnate. A species with white, soft wood and tripartite leaves is very abundant; it is called "Jumbo" by the natives, and from the liber of its bark they make their cloth. Acacias are very plentiful; they abound in both marshy and dry places. There are several species, one has the peculiarity of being flat on the top. A species more in the nature of a shrub than a tree is when in flower a complete mass of yellow bloom, giving out a delightful odour. Gum exudes spontaneously from all the species; one kind is very pure and clear, another brown. There are no Tamarind or Baobab trees in the neighbourhood of Blantyre, but 30 miles north of this they are plentiful. Here and there is a species of Fig tree. Lime trees [?] at one station have cast their foliage twice since November, and are in full foliage now. They are plentiful, but the fruit has never come to maturity. The order Proteaceæ is well represented. There are many nice shrubs belonging to the Willow order. *Kalmias* are plentiful and beautiful [?]. The orders Leguminosæ and Compositæ have in numbers the advantage of the other orders. There is a vast number of creeping and twining plants in Papilionaceæ; some of them are so strong and tough that I have occasionally used them as garden-lines. Next to these orders come Orchidaceæ, Labiatæ, Liliaceæ, and Amaryllidaceæ. There are many distinct species of Orchids, both epiphytal and terrestrial. Five of the latter are particularly nice—a yellow, a purple, a red, and two white species. Labiatæ has many showy plants, chiefly about waste places. I have seen some lovely specimens in Liliaceæ. Several species of Aloes are found on the hills and mountains. We have about 400 plants beautifying our station. The natives brought them for sale; the price was an inch of calico per plant. The plants which I have seen in Amaryllidaceæ have very large bulbs; they average 6 inches in diameter. A species of Castor-oil plant grows profusely about old gardens. The natives by boiling extract an oil from the seed, which they use chiefly for adorning their persons. The orders I have mentioned are the most conspicuous, but very many more are represented. I feel confident in saying that there are here many flowers and plants which, if once brought home and cultivated, would compare favourably with any yet introduced. Ferns as well as flowers are here in abundance. At a stream above the station I have observed about twelve different species. There are *Adiantums*, *Lastreas*, and *Athyiums*, *Polystichums*, *Polypodies*, and *Osmundas*. A noble-looking *Osmunda*, in which I have seen no difference from *Osmunda regalis*, is in endless quantity. On the hills and mountains, as well as in the lower grounds, Ferns are abundant. Thrice I have gone Fern-hunting to the mountains, and twice I was forced to return drenched with rain. There I found quite different forms of plants from those in the streams. A species identical with *Las-trea montana* is everywhere present. Where two or three stones are heaped together, there it appears. I found amongst some stones a species very different from what I had before seen. It is about 4 inches high—frond almost a circle; in many parts I should say about one-eighth of an inch broad. These parts fold slightly in the back, and enclose the spores. I have seen species of *Lindæa*, *Lomaria* and *Pteris*; I have just seen one species of moss; there are a few species of Lichens and fungi; one species of Mushroom is very large, and is eaten by the natives. Whilst an outhouse was being levelled I discovered what I presume to be a species of Truffle; they were of a small size, oval-shaped, skin hard and black. I have seen several nice grasses which, if grown at home, might pass as ornamental. The chief crops cultivated by the natives are Indian Corn, Ground Nuts, Beans, Sweet Potatoes, and Pumpkins. There are no Water Melons in the neighbourhood. Indian Corn is the staple food of the country, from it they make a flour which they call Ufa. The corn being taken off the cobs, it is stamped in a stamper along with a little water. This finished it is taken and sifted, not through a sieve, but simply shaken until all but the flour is shaken out. This flour when made into porridge changes its name from that of Ufa to Usima. Englishmen use a large quantity

of this flour in porridge and bake it into bread. Ground Nuts grow well, and when roasted are very good. They cultivate different kinds of Beans. One sort is identical with the French Bean; it may have been introduced by the Portuguese. Two varieties are white, one black, and one, a round Bean contained in a thin pericarp, has the peculiarity of growing attached to the root fibres underground. The Sweet Potatoes which they cultivate are inclined to be small; it is quite the opposite in our garden, but perhaps new ground may have something to do with it. Here and there an occasional patch of Sugar-cane may be seen grown for no other purpose than that of eating it. Sugar-cane is extensively grown in some places on the Shire river. Bananas are the only fruit they cultivate.

I must now say a few words regarding what has been done in the way of gardening at Blantyre. We arrived here on October 24, just in time to get our seeds sown before the rains. The first thing to be done was to get ground prepared for Rice and Sugar-cane, and accordingly a number of natives with hoes were at once set to work. On November 10th, 14th, and 15th Rice was planted; it "briered" in eight days, and looked well until the end of January. The soil was of a peaty nature. The month of February was very dry, scarcely any rain fell. Its growth was severely checked, and though rain was plentiful in March it never recovered, and was reaped about the end of May, a poor crop. A small piece of ground which was very wet, in which the Rice was transplanted, produced a good crop. I don't think Rice can be grown here without irrigation. Indian Corn grew admirably, but the seed, which came from Edinburgh, was a complete failure. I found Sweet Potatoes to be a crop easier cultivated, and still easier propagated. I got a number of plants from an old garden and planted them, which in a short time gave me plenty of cuttings. The cuttings I made about a foot long, took off the leaves, and put them in the ground about 3 feet apart. They quickly rooted and covered the ground. A small portion was sown with the oil seed called Sesame, and was a fair crop. This we shall cultivate largely, as it is the chief article of export.

On November 9 I made a general sowing of English vegetable seeds, Cabbages, Lettuces, Cauliflowers, Carrots, Onions, Leeks, Beetroot, Peas, Melons, Cucumbers, and Tomatoes. For the most of these I can scarcely report anything but a failure. The Windsor and common field Bean a total failure, as also Mangel Wurzel, Kohl Rabi, and Turnips. At various times I made sowings of English grains, Wheat, Rye, and Barley. Of these not even one grain has vegetated. I can in no way account for such failures, as the seeds seemed quite good and the soil in fine order when these trials were made. A variety of Wheat from the lower Shire has done tolerably well. Sown on April 2, it is being reaped now; it is short in growth but the ears cannot be complained of. From Mr. McGibbon, in the Botanic Gardens, Capetown, we got a varied collection of seeds, amongst which were two varieties of Oats; the Cape feeding Oat, and the Queensland Oat. They have grown as well as could be expected. The Cape feeding Oat is grown in the colony for no other purpose than that of making hay. The Queensland is different, it is much like the Sandy Oat at home. From Mr. McGibbon we got Tea, Coffee, and Cotton (Sea Island) seeds. I have made several trials of the former but without any result. The Tea-nuts swelled as if to vegetate, but they rotted instead of doing so. I think the Coffee seed must have been too old. The Cotton grew pretty well. The climate here is delightful and healthy, the rainy season is not what people make it; commencing about the middle of November it finishes with the end of April. I have not seen a whole day of rain. In January we had rain nearly every day, but generally in showers of short duration. In February there was little rain, March had plenty but not to be complained of. The dry season is from May to November. Now it is very dry, and vegetation I may say is at rest. I am keeping a record of temperatures. The heat is in no way excessive, the highest temperature since May has been 134°; at mid-day it ranges between 80° and 100°. The ground heat at mid-day averages about 70°; the highest I have seen was 82°. During night the ground temperature falls on an average from 10° to 12°. I shall try this season and keep an account of the rainfall. Blantyre, you are aware, is about 3000 feet above the sea level, on what Livingstone called the third plateau of the Shire Hills.

3. *Effects Produced on Vegetation by the recent Sunless Summers*. By Mr. M'Nab, Curator, Royal Botanic Garden.—As vegetation for the present year is now drawing to a close, I think it desirable that a few remarks should be recorded as to the deficiency of certain fruits, flowers, and vegetables, so as to afford comparison with future seasons. A considerable portion of the summer of 1876 was comparatively sunless and moist, so much so that the bearing branches of many fruit trees and flowering shrubs were not sufficiently ripened to produce healthy flowers or fruit, and, therefore, a deficiency in the crop of 1877 has been

the result, although the winter of 1876-77 was rather mild. This season, like the previous one, has also been sunless and moist, and, therefore, many vegetable productions were never properly matured. At the present time, as far as can be ascertained, the flowering shoots of many shrubs and fruit trees do not appear sufficiently strong to warrant us to expect a full crop another year, two good consecutive seasons being generally necessary for this purpose. The late mildness is causing many fruit trees, particularly Pears, to produce late blossoms, which will also be against next year's expectations. In cases where fruit-bearing wood has been ripened by a previous fine summer, it sometimes happens that the fruit blossoms are ruined by late spring frosts. A slight touch of frost occasionally during the spring months is, however, sometimes desirable, for if all the blossoms produced were to come to maturity the trees would often run a risk of being injured by an excess of small-sized fruit. With a season like last year (1876) the wood formed during the year was not thoroughly ripened, and when the flower-buds of many fruit trees opened in 1877 they were in general weak and frequently colourless, particularly the pink-flowering kinds, and in numerous instances fell off without fruit being formed. In those cases where fruit was produced a deficiency in flavour was generally remarked. This deficiency in flavour was particularly noticeable in many of the finer wall and standard open-air fruits, such as Peaches, Nectarines, Apricots, Plums, and Cherries, as well as Apples and Pears; also on many of the smaller fruits, as Gooseberries, Strawberries, Raspberries, &c. Although some kinds of Apples fruited freely, some tolerably well perfected, the majority were miserably small and unripe, and many are still seen hanging on the leafless trees. Deficiency of fruit was observed on many of the hardy trees, as well as native fruit-bearing plants, such as Crab Apple, Medlar, standard Plum, black Sloe, Strawberry tree (*Arbutus Unedo*), common Black Elder, Bramble, Barberry, Mahonia, particularly *M. Aquifolium*, *Gaultheria Shallon*, *Ribes sanguineum*, Portugal Laurel, and Laurustinus. Amongst the hardy ornamental trees and shrubs noticed as being freely covered with fruit were the varieties of the Service or White Beam tree (*Sorbus domestica*), also the Mountain Ash, Cotoneaster, Thorn, Yew, Snowberry, and almost all the varieties of Holly. Although the Holly was rarely to be seen in fruit last year, this dearth was evidently caused by frost, 167° having been registered during the months of March and April, 1876, at a time when the blossom of the Holly was approaching perfection. This spring the Holly was later in blooming, and thus escaped certain spring frosts, and a profuse crop of fruit is the result. Of the smaller description of hard fruits, Filberts and Hazel are also scarce. The latter were freely covered with catkins during the month of January, the earliest flowers being seen on the 1st, hastened no doubt by the previous mild December, as recorded in the Botanical Society's Report for February, 1877. The severe frosts which occurred towards the end of January and beginning of February completely destroyed the catkins while in perfection, turning them from a rich yellow to brown, and hence the result. (See Botanical Society's Report for March, 1877.) Fruit is likewise scarce amongst ornamental fruit-bearing and forest trees. In this part of the country Walnuts are excessively small, none approaching ripeness. The Horse Chestnut trees are this year fruitless, the leaves being much infested with insects during spring, the flowers became injured, and few opened. Eatable Sweet or Spanish Chestnuts are also scarce. A great scarcity is also noticeable in the seedling of the Norway Maple, Elm, Oak, Birch, Lime, and Beech. The Norway Maple and Elm were freely covered with flowers during the early part of April. Throughout that month we experienced collectively 50° of frost, which must have injured the flowers of these trees, and probably many others which flowered about the same time. The Beech in many districts is covered with masts, but almost all are empty. This scarcity, as well as other instances recorded, I consider in a great measure arises from the unripened state of the wood, which, although sufficiently strong to produce flowers, was not strong enough to resist frosts, which they are capable of doing when thoroughly ripened by a previous fine summer. On some of the varieties of Fraxinus, Ash keys are to be seen in abundance, but the great majority of the trees are fruitless, while with the Sycamore trees, the samara in some cases are plentiful, but generally they are entirely wanting, even on those trees which usually fruit in abundance. In many situations the young growths of the Sycamore and other trees are observed to be short and twiggy when compared with the growths of previous years, while the new-made growths on Conifers is very luxuriant. Laburnums flowered well during the spring months, and are now covered with seeds. Although cones of *Abies Douglasii* are in many places plentiful, few seeds seem to be perfected in them. Seeds are also scarce on many annual and perennial herbaceous plants; this, however, is greatly owing to the excessive mois-

ture at the time they were in bloom. We annually collect seeds from our own Sweet Peas and Mignonette, but this year not one pod has ripened on the former, nor a seed on the latter. Many perennial herbaceous plants were also very late in coming into bloom, and as a rule far from strong. Dahlias, Hollyhocks, and Gladioli were rare at most exhibitions, as well as Roses and other florist's flowers. Almost all bedding out plants were more or less failures, such as Scarlet Pelargoniums, Verbenas, Calceolarias, &c. Tritomas, particularly T. Uvaria, were hardly seen in flower this year before the middle of October, and the Pampas-grass (*Gynerium argenteum*) not till the middle of November, and those only in favoured situations.

Many vegetables are also deficient, Potatoes in many districts scarce and inferior in quality, as well as Jerusalem Artichokes, Beetroot, Carrots and Parsnips, are generally small, although good in quality. Many varieties of Peas, French Beans, and Scarlet Runners quite a failure, as well as Cauliflowers. Cucumbers and Vegetable Marrows were also a failure, the stems in many cases became diseased, and little or no fruit was produced. Many other examples might be quoted, the foregoing, however, are sufficient as a record of the season of 1877 in the neighbourhood of Edinburgh. In many parts of England the scarcity of several of the above articles is also complained of, although exceptions are to be found in some places, both in England and Scotland.

Judging from present appearances we are likely to experience the same difficulty as last year in forcing many of the hardy shrubs, &c., into flower, in consequence of the unripened state of the wood and flower-buds, also caused by the recent sunless summer.

This autumn has likewise been remarkable for the want of the usual autumnal tints on the leaves of the various forest and ornamental trees. During those seasons when the wood and leaf shoots have been thoroughly ripened, the autumnal tints are very beautiful in reds, rich yellows, and browns, while this year, with the exception of the Medlar and Sorbus vestita, which are now yellow, also certain Azaleas, and *Ampelopsis tricuspidata* (the latter on a wall), most other kinds have passed away of a dingy olive green colour, and in many instances blown off in consequence of the severe gales to which they were exposed. The Liquidambar (*Liquidambar styraciflua*), is generally one of the latest trees to part with its leaves, which are always of a dark red colour. They are still hanging flaccid on the trees (December 13, 1877) of a greenish colour, showing the unripe state of the wood.

The scarcity of wasps has also been remarked. Honey is likewise a failure, the wet season having been much against the working of bees.

4. *Miscellaneous Notices.*—1. Professor Balfour read a note which he had received from Count G. M. Hamilton, Hedensberg, Sweden, in which he says, "I never remember such an autumn, or rather winter. I do not think it is favourable for trees or plants. On December 7 there were found in flower near Stockholm—*Veronica agrestis*, *Phleum pratense*, *Alopecurus geniculatus*, *Viola tricolor*, *Stellaria graminea*, *Potentilla argentea*, *Raphanus sativus*, and many others. In general at that time we have snow in Sweden, especially in these northern parts, and it is certainly preferable to this rainy weather, which will, I fear, spoil many of our plants." Count Hamilton also mentions that several of Linnæus' letters and correspondence are to be published next year.

2. Mr. Stephen Wilson, of North Kinnundy, exhibited and presented to the museum at the Botanic Garden, sample of meal made from *Aegilops ovata*, accompanied by a note, in which he says, that this meal, the produce of the first crop, serves as a proof that no chage is required upon the grass to make it a bread-corn. The difficulty is in the decortication of the grain, a labour which hardly anyone would venture upon. He decorticated about 5½ ounces, and ground a quarter of a pound. M. Fabre does not say that he made meal or bread from the grain.

3. Messrs. Whytock and Reid presented to the Museum a section of log of Walnut, in which were completely embedded several large stones. The log had been received from the Mediterranean.

The following office-bearers for 1877-8 were elected:—President—Thomas Alexander Goldie Balfour, M.D., F.R.S.E., F.R.C.P.E. Vice-Presidents—Sir Wyville Thomson, LL.D., F.R.S.; Isaac Anderson-Henry, F.L.S., F.R.S.E.; Sir Robert Christison, Bart., M.D., D.C.L.; W. B. Boyd, of Ormiston. Councillors—William Craig, M.D., C.M., F.R.C.S.E., F.R.S.E.; Malcolm Dunn, F.R. Cal. Hort. Soc.; George H. Potts, of Fettes Mount; Isaac Bayley Balfour, Sc.D., M.B., C.M.; John Methven, F.R. Cal. Hort. Soc.; James T. Wilson, of Restalrig House; Alexander Buchan, A.M., F.R.S.E.; William Gorrie, of Kait Lodge; Charles S. France, F.R. Cal. Hort. Soc.; Hugh Cleghorn, M.D., F.R.S.E. Honorary Secretary—Professor Balfour, M.D., F.R.S.S.L. and E. Honorary Curator—The Professor of Botany. Foreign Secretary—Professor Dickson, M.D., F.R.S.E. Treasurer—Patrick Neill Fraser, F.R. Cal. Hort. Soc. Assistant Secretary—John Sadler, F.R.P.S.

Obituary.

WE regret to announce the death, on the 21st inst., at Fordel, Fifeshire, of Mr. ROBERT FOULIS, in his 80th year. Mr. Foulis, whose portrait and autobiography were given in our issue for April 15, 1876, was for a little over half a century gardener and forester at Fordel, a position which his predecessor had held for no less than sixty-three years. He was long and honourably known as a very successful horticulturist, a keen arboriculturist and geologist, a popular lecturer, and one of the most estimable of men. In February, 1876, he was awarded the Neill Prize by the managers of the Royal Caledonian Society—an honour well deserved, and which he highly appreciated. So recently as October last Mr. Foulis received the congratulations of his many friends on the completion of his fiftieth year of service at Fordel, at a complimentary dinner given in Edinburgh, when he was also presented with a gold watch and a purse of sovereigns, to commemorate so rare an event.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DEC. 26, 1877.

Dec. 20.—A dull, cloudy day. Slight rain in morning. Cool.
 21.—A very dull damp day. Slight rain at intervals.
 22.—Overcast, dull, and mild throughout.
 23.—A fine bright day. Cool. Partially cloudy.
 24.—Overcast, dull, with occasional slight showers till 2 P.M. Fine and bright after. Cold at night.
 25.—A very fine day. Cold. A little snow fell at 2 A.M.
 26.—A very fine bright day. Cold. Snow fell about 6.30 A.M.

LONDON: *Barometer.*—During the week ending Saturday, December 22, in the suburbs of London the reading of the barometer at the level of the sea decreased from 30.41 inches at the beginning of the week to 30.30 inches by the afternoon of the 16th, increased to 30.43 inches by the morning of the 17th, decreased to 30.35 inches by the afternoon of the same day, increased to 30.70 inches by 9 A.M. on the 20th, decreased to 30.49 inches by the afternoon of the 21st, increased to 30.55 inches by the night of the same day, and decreased to 30.02 inches by the end of the week. The mean reading for the week at sea level was 30.45 inches, being 0.34 inch above that of the preceding week, and 0.44 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 49½° on the 22d to 39½° on the 19th; the mean value for the week was 45½°. The lowest temperatures of the air observed by night varied from 28½° on the 19th to 43° on the 17th; the mean value for the week was 37°. The mean daily range of temperature in the week was 8½°, the greatest range in the day being 12½° on the 18th, and the least 4½° on the 17th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—16th, 44°.8, +4°.1; 17th, 45°.3, +4°.8; 18th, 39°. — 1°.2; 19th, 33°.4, — 6°.6; 20th, 40°.8, — 1°.1; 21st, 42°.3, +3°; 22d, 45°.3, +6°.5. The mean temperature of the air for the week was 41°.6,

being 1°.5 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 59° on the 18th, 56° on the 16th, and 55½° on the 17th; on the 20th the highest reading was 45°. The lowest readings of a thermometer on grass with its bulb exposed to the sky were 26° on the 19th, 29° on the 18th, and 33° on the 21st; on the 17th the lowest reading was 39½°.

Wind.—The direction of the wind was principally from the W., and its strength gentle. The weather during the week was dull and miserable. Fog prevailed on the 18th and 19th.

Rain.—Slight rain fell on three days during the week; the amount measured was 0.05 inch only.

ENGLAND: *Temperature.*—The highest temperatures of the air observed by day were 52½° at Liverpool, and 52° at Truro, Leeds, and Sunderland; the highest temperature of the air at Wolverhampton was 48½°, and at Portsmouth was 48½°; the mean value from all stations was 50½°. The lowest temperatures of the air observed by night were 27½° at Norwich, 28½° at Blackheath, and 29° at Bristol and Cambridge; the lowest temperatures of the air at Sunderland was 38°, and at Liverpool was 34½°; the mean value from all stations was 31½°. The range of temperature in the week was the greatest at Norwich, 22°, and the least at Sunderland, 14°. The mean range of temperature from all stations was 19°.

The mean of the seven high day temperatures was the highest at Truro, 51½°, and at Plymouth, 49°, and the lowest at Norwich, 44½°, and at Hull, 45°; the mean from all stations was 47°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 34½°, and at Nottingham, 34½°, and the highest at Sunderland, 41½°; the mean from all stations was 38°. The mean daily range of temperature in the week was the least at Norwich and Sunderland, 7°.2; and the greatest at Northampton, 11½°, the mean daily range from all stations was 9½°.

The mean temperature of the air for the week was 42½°, being 1½° higher than the value for the corresponding week in 1876. The highest was 46°, at Truro, and the lowest was 40°, at Wolverhampton.

Rain fell on three or four days in the week at most stations, the amounts measured varied from ¼ of an inch at Plymouth and Truro, to 0.05 inch at Blackheath; the average fall over the country was 0.14 inch.

The weather during the week was dull, and the sky generally overcast. A *lunar halo* was seen at Bradford on the 20th.

SCOTLAND: *Temperature.*—The highest temperatures of the air observed by day varied from 55° at Perth to 50½° at Greenock; the mean value from all stations was 52½°. The lowest temperatures of the air observed by night varied from 32° at Aberdeen to 40° at Glasgow; the mean value from all stations was 37½°. The mean range of temperature in the week from all stations was 15°.

The mean temperature of the air for the week was 44½°, being 6½° higher than the value for the corresponding week in 1876. The highest was 46½° at Glasgow, and the lowest 41½°, at Aberdeen.

Rain.—The amounts of rain measured varied from 1.17 inch at Greenock to 0.04 inch at Leith and Perth. At Dundee no rain fell. The average fall over the country was 0.35 inch.

DUBLIN.—The highest temperature was 52°, the lowest was 26½°, the range was 25½°, the mean was 43½°, and the fall of rain 0.18 inch.

JAMES GLAISHER.

Variorum.

THE REGISTRATION OF LETTERS.—On and from January 1, 1878, the following changes will be made in the system of registering letters:—1. The registration fee will be reduced from 4d. to 2d. 2. For the convenience of persons living in country places, where no post-office is near, letters will be registered by rural post messengers, who will receive letters for registration on their outward and on their inward walks, whenever it is practicable for them to do so. 3. In the event of a registered letter containing an enclosure of intrinsic value, or its contents, being lost while passing through the post, the department will, under certain regulations, make good the value of the contents up to £2. These regulations will be published shortly; but the following are some of the principal conditions:—(a) That the sender of the letter duly observed all the conditions of registration required. (b) That the letter was securely enclosed in a reasonably strong envelope; and, if it contained money, that it was enclosed in one of the special registered letter envelopes which will be sold by the Post-office for the purpose. (c) That application was made to the Secretary of the Post-office immediately the loss was discovered. (When

the complaint is that the contents of a letter have been abstracted, the envelope must accompany the application; otherwise the question will not be entertained.) (d) That the Postmaster-General, whose decision shall be final, is satisfied that the loss occurred while the letter was in the custody of the British Post-office, and was not caused by any fault on the part of the sender. 4. Registered letter envelopes, bearing a 2d. stamp for the payment of the registration fee, will be sold at all post-offices and by rural messengers. To begin with, envelopes of the following dimensions will be supplied:— $\frac{1}{2}$ inches by $\frac{3}{4}$ inches, and 6 inches by $3\frac{3}{4}$ inches; these will be sold for 2 $\frac{1}{2}$ d. each, or 2s. 2 $\frac{1}{2}$ d. for a packet of twelve—the registration fee being included in the prices. Three larger sizes will be sold hereafter, and due notice will be given of their dimensions and prices. 5. The postage must be prepaid by affixing the necessary stamps; the impressed stamp, which the envelope bears, represents the registration fee only. 6. A letter intended to be registered must not be dropped into a letter box, but must be given to an agent of the Post-office to be registered. 7. Inland letters containing coin, jewellery, or watches, cannot be sent unregistered. If dropped into a letter-box, they will, as heretofore, be registered by the Post-office, and charged on delivery with a registration fee of 8d.; a similar fee of 8d. will be charged on letters (without regard to their contents) marked "registered," but posted unregistered instead of being given to a Post-office servant. No letter containing coin, jewellery, or watches, can be sent, even if registered, to any foreign country. 8. The Postmaster-General hopes that when registration is made so cheap and so easy, the public will altogether abstain from sending letters containing enclosures of value through the post unregistered. 9. Concurrently with these changes the scale of charges for inland money orders will be altered by raising the rate now charged for orders under 10s. from 1d. to 2d., and the rate for orders of 10s. and under £1 from 2d. to 3d. Consequently, on and after January 1 next, the scale of charges for inland money orders will be as follows:—

For sums under 10s.	2d.
" of 10s. and under £2	3d.
" " £2	4d.
" " £3	5d.
" " £4	6d.
" " £5	7d.
" " £6	8d.
" " £7	9d.
" " £8	10d.
" " £9	11d.
" " £10	1s.

FRENCH HORTICULTURAL INDUSTRY. — The Central Society of Horticulture in France has just published some official statistics calculated to show the importance of this industry in France. According to the Customs Administration Tables, the average annual export of fruit from 1827 to 1836 was but 93,000 kilogrammes of Oranges and Lemons, and 2,300,000 kilogrammes of other fresh fruits. In 1874 the exports had reached the following figures:—

Oranges and Lemons	3,307,612
Fresh fruits for the table	43,349,424
Dry and pressed fruits	14,156,046
Candied and preserved fruits	3,402,390
Almonds, Walnuts, and small Nuts	15,295,653
				78,479,227

—equal to about 7700 tons. This is inclusive of Chestnuts, which in the same year furnished 6,398,486 kilos., and of Potatos, the exports of which from France amounted to 175,779,230 kilos. It is impossible to ascertain with any precision the quantity of fresh and dried fruit and vegetables consumed in the interior of France, but the commerce of Paris will give some idea of the quantity. In 1872 there was sold wholesale in the central public markets of Paris:—

Choice fruits	802,548
Ordinary fruits	3,234,307
Choice vegetables	678,084
Ordinary vegetables	1,831,695

In the quarries in the environs of Paris, 79,000 square metres of surface are devoted to the culture of Mushrooms, producing 1,800,000 francs of produce (£72,000); and finally, the sales made yearly in the four flower markets of Paris reach £80,000. The Chamber of Commerce of Paris in 1872 returned 25,804 persons in the Department of the Seine occupied as farmers, market gardeners, horticulturists, florists, and Mushroom growers, who obtained annually by their labour about £1,100,000. M. Husson, a well-informed authority, estimates that Paris receives from the South yearly 20,000,000 kilos. of early products, from the environs 259,000,000 kilos. of various vegetables, exclusive of 17,000,000 kilos. of dried vegetables which enter into consumption. There is also a grand production of Roses in France, in which she is distinguished above other countries; also many flowers and plants for which her climate is well suited, and also the raising of young fruit trees,

Answers to Correspondents.

ADIANTUM: *H. H.* The specimens sent are *A. excisum multifidum*, which comes variably crested; they are not at all like *A. amabile*.
 AGAVE VIVIPARA: The Agave figured as vivipara at tab. 150 is not the plant described in the text under the name of vivipara, but *A. sobolifera* of Salm-Dyck, which is often grown as vivipara in English gardens. *J. G. B.*
 ANTS: *J. B. A., Mentone.* Try an application of petroleum in their tracks.
 BOOKS: *Young Gardener.* From Mr. E. H. May, 171, Fleet Street, E.C., price 2s.—*J. W. B. Brown's Forester, or Grigor's Arboriculture.* The first named for choice.
 CHRYSANTHEMUM: *H. C.* Your sport from Prince Albert is likely to prove a fine variety. At present it is rather thin, but that may arise from its being a late flower. It is a very pure white, and will be useful for decoration if it always blooms late.
 COPINGS FOR GARDEN WALLS. (*Erratum, p. 787.*) In line 10 from the top, for "screw" read "scrim." It is a thin cloth manufactured in Dundee, principally for protecting the blossom of fruit trees, and very suitable for the purpose.
 INSECTS: *W. W. R.* The very minute circular white spots on the Ivy leaf sent are females of one of the Coccidæ—*Aspidiotus hederae* of Vallot. Will Mr. "R." state the species of Ivy and the locality where grown? *I. O. W.*
 NAMES OF PLANTS: *W. P.* *Bignonia venusta* and, we think, *Streptocarpus Rexii*.—*G. W. 3.* *Stevia eupatoria*, or some near ally.—*W. T. 1.* *Davallia novæ zealandiæ = Acroporus hispidus*; 2, *Lastrea quinqueangulare*; 3, *Asplenium Adiantum-nigrum*; 4, *Eriobotrya japonica*.—*J. B. A., Mentone.* The shrub is *Deeringia Amherstia variegata*. The other we do not recognise at present.
 STACKING STRAWBERRIES, &c. The title of Mr. Hind's letter, at page 788, should have been "Stacking Strawberries, and Starting them in Bottom-heat," instead of as there printed.

* * The demand for flowers being much increased for Christmas decorations, &c., the above prices must only be taken as a guide, and must not be fully relied on.

SEEDS.

LONDON: Dec. 26.—Our markets are now quite of a holiday character, the business doing being almost nil. Probably the new year will be two or three weeks old before any active demand arises for agricultural seeds. The supply of French Clover continues fully sufficient for present requirements; but the opinion is said to now obtain with some Paris houses that, in consequence of the recent political misgivings, and the commercial timidity and desire to realise resulting therefrom, the French have lately been over-shipping red seed to this country, and that their own wants during the approaching sowing season have accordingly been largely overlooked. This statement must, of course, be taken for what it is worth. The specimens of Canadian Clover which have just been received here prove disappointing, and exhibit a great falling-off in quality from those of last year; unless, indeed, there are finer samples to follow, Ontario this season will be unable to compete with Southern France. Although there appears no reason to doubt that the American yield is this year very large, it is worth noting, that on account of the low prices, unfavourable threshing weather, and heavy home consumption, the receipts at the Western depôts have been less this autumn than last. For example, the arrivals down to the end of last month in the important city of Toledo, State of Ohio, were 6000 bags less than for the corresponding period of 1876. Canary, Linseed, and all other articles, offer, in the absence of transactions, no subject for remark. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E. C.*

CORN.

At Mark Lane on Monday business was quite of a holiday character. There were a few millers in attendance, and these operated with extreme caution in Wheat. The political agitation seems not to affect in the least the course of the trade, but the advanced period is beginning to be felt in the gradual hardening of the rates for foreign produce. On Monday higher prices were asked and invariably given for parcels of Wheat to arrive. Barley was well held, especially malting, but there was only a small demand. Malt remained stationary. Oats were quite as dear, without being much sought after; and a steady market prevailed for Maize. Beans and Peas were offered on former terms. Flour was dull and not very well supported as to prices. The market was not open on Wednesday, it being a statute holiday.—Average prices of corn for the week ending December 22:—Wheat, 51s. 4d.; Barley, 43s. 3d.; Oats, 25s. 11d. For the corresponding week last year:—Wheat, 50s. 8d.; Barley, 38s. 7d.; Oats, 25s. 2d.

CATTLE.

At the Metropolitan Market on Monday the number of beasts was rather larger than expected for a holiday market. There was a good attendance of buyers for the day, and the weather being favourable trade rather improved. Best qualities were readily disposed of at an advance on last Thursday's quotations. The number of sheep was very small, but this article is not in much request at this season. Trade was fair, and choice descriptions made a good price. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 6s.; calves, 5s. to 6s. 4d.; sheep, 5s. 6d. to 5s. 10d., and 6s. 4d. to 7s.; pigs, 3s. 6d. to 4s. 8d.—On Thursday trade ruled quiet, but rather steadier, owing to the cold weather. Beasts were a shade dearer than on Monday, and sheep realised full prices. Calves were quiet.

HAY.

At the Whitechapel market on Thursday there was a short supply on offer. Trade was quiet, and prices as follows:—Prime Clover, 100s. to 138s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 102s. 6d.; inferior, 70s. to 85s.; and straw, 44s. to 56s. per load.

POTATOS.

At the Borough and Spitalfields markets sound Potatos command a steady sale, but the trade is irregular for inferior kinds.—Kent Regents, 150s. to 185s.; flukes, 170s. to 180s.; London, 140s. to 180s. per ton.—The imports into London last week consisted of 39,606 bushels from Charlotte Town, 23,320 bags Hamburg, 3072 Bremen, 1256 sacks 1240 bags and 46 tons Dunkirk, 2568 bags Antwerp, 1267 Stettin, 614 Boulogne, 444 barrels New York, 427 bags 90 tons Rouen, 474 bags Rotterdam, 526 Ghent, 200 Harlingen, and 160 tons Brussels.

TO THE SEED TRADE. OUR WHOLESALE CATALOGUE

is now ready, and may be had on application. A copy has been posted to all our Customers, if not received an early intimation will oblige.

MINIER, NASH AND NASH, 60, Strand, London, W.C.

ROSE BUDS.

All who wish to have a succession of Roses from the open ground, from June to November (without forcing), should plant

QUEEN of BEDDERS (Noble).

See Gardeners' Chronicle, May 5. A beautiful bouquet was cut from open ground Nov. 20, 1876. Price is within reach of everybody.

CHARLES NOBLE, BAGSHOT

TO THE TRADE. LIMERICK SEED AND NURSERY COMPANY, 8, GEORGE STREET, LIMERICK. Established upwards of Half a Century.

EDWARD BAKER

Respectfully intimates that he has purchased the interest in the old established business, so successfully carried on by Alderman Abraham, J.P., at the above address, and is now prepared to receive TRADE LISTS and Special Offers of AGRICULTURAL and GARDEN SEEDS.

NOW READY,

Price 1s.; post-free, 1s. 3d.; or Gratis to Purchasers.

IT CONTAINS

TWO BEAUTIFUL and FAITHFULLY COLOURED PLATES,

BESIDES

Several Hundred Illustrations of New and Choice Flowers and Vegetables.

In it will also be found many

Concise and Practical Instructions

that will ensure Successful Cultivation; in fact, it is

The handiest and most comprehensive Guide

FOR

AMATEURS and GARDENERS

yet published.

Carter's

THE QUEEN'S SEEDSMEN, HIGH HOLBORN, LONDON, W.C.

SPECIAL NOTICE.

DENDROBIUM SUBERBIENS (Reich. filis).

B. S. WILLIAMS

having at present several fine plants of this new and magnificent Dendrobe in flower, received some time ago from his Collector (which, according to Professor Reichenbach, is now flowering for the first time in Europe), will be glad to be honoured with a visit from any one who may be interested in this class of plants.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

SEAKALE, ASPARAGUS and RHUBARB.

Roots for forcing, exceptionally fine, very low prices. For special quotations apply to H. THORNTON, 12, Maxwell Road, Fulham, S.W.

Cucumber, Rollisson's Telegraph.

H. J. HARDY begs to offer to the Trade, SEED of his SELECTED STOCK of the above, by the 100 Seeds or the Ounce. Cash or reference. Price on application to H. J. HARDY, Stour Valley Seed Grounds, Bares, Suffolk.

Fruit-bearing Trees.

FINE STANDARD and PYRAMIDAL PEARS—A large quantity of the above to be sold cheap, the land being required for other purposes. Inspection invited. No reasonable offer refused. All recently removed. JOHN STANDISH AND CO., Royal Nurseries, Ascot, Berks.

W. BALL AND CO. beg to offer the under-mentioned PLANTS, all of which are strong and well established:—

- AURICULAS, finest mixed Alpine, in 54-pots, 4s. per dozen, per 100, very strong. ALYSSUM SAXATILE COMPACTA, 6s. per 100. CLOVES, The Bride and The Ghost, pure white, sweetly scented, in 60-pots, very strong, 22s. 6d. per 100. DAISY, The Bride, the finest of all whites, 7s. 6d. per 100. Rob Roy, 6s. per 100. Giant, variegated, 6s. per 100. ACUBEFOLIA, fine, 7s. 6d. per 100. PANSY, Blue King, 8s. per 100. Cliveden Blue, 8s. per 100. Cliveden Purple, 8s. per 100. Cliveden Yellow, 6s. per 100. Dean's White, 6s. per 100. PINKS, in twelve named varieties, in 60-pots, 25s. per 100. PRIMROSES, double Yellow, 20s. per 100. single Lilac, 12s. per 100. RÖCKETS, double Purple, 2s. 6d. per dozen, 18s. per 100. double White, 2s. per dozen, 15s. per 100. SILENE PENDULA COMPACTA, 2s. 6d. per 100. STOCKS, Scarlet Queen, 2s. per 100. TRITOMA UVARIA, 4s. per dozen, 28s. per 100. All the above cheaper by the 1000. Orders amounting to 20s. boxes and packing free. The Nurseries, Bedford Road, Northampton.

FINE STANDARD ORNAMENTAL TREES, &c., for Immediate Effect.

- ASH, Mountain, 8 to 10 feet, fine, 10s. to 12s. per dozen. BEECH, Green, 10 to 12 feet, fine, 18s. to 24s. per dozen. BIRCH, Silver Weeping, 12 to 15 feet, fine, 18s. to 24s. p. doz. CHESTNUT, Horse, 8 to 10 feet, fine, 10s. to 12s. per dozen. Scarlet, 8 to 10 feet, fine, 12s. to 15s. per dozen. ELMS, Giant Canadian, 15 to 20 feet, fine, 25s. to 30s. per doz. English grafted, 10 to 12 feet, fine, 18s. to 24s. per dozen. LIMES, 10 to 12 feet, 10s. per dozen. LABURNUMS, 10 to 12 feet, fine, 9s. to 12s. per dozen. OAK, English, 10 to 12 feet, fine, 18s. to 24s. per dozen. POPLAR, Silver, 12 to 15 feet, fine, 18s. to 24s. per dozen. Black Italian, 12 to 15 feet, fine, 9s. to 12s. per dozen. Lombardy, 10 to 12 feet, fine, 9s. to 12s. per dozen. Descriptive CATALOGUE of General Nursery Stock post-free on application. W. BALL AND CO., The Nurseries, Bedford Road, Northampton.

Small crates packed to travel safely any distance. WILLIAM BRYANT, The Nursery, Rugby.

THE NURSERIES,

Wandsworth Common, Garratt Lane, and Tooting. The Nurseries comprise 70 acres of a remarkably useful and well grown stock of HARDY SHRUBS, FRUIT FOREST, and ORNAMENTAL TREES, CLIMBING PLANTS, &c. especially adapted for planting near London. A personal inspection earnestly solicited. Catalogues free on application to R. AND G. NEAL, Chief Office, Wandsworth Common. The Nurseries are situated one mile from Clapham Junction, on the highroad from Wandsworth to Tooting, and a quarter of a mile from Wandsworth Common Station, London, Brighton, and South Coast Railway.

Queen of Lilies, Lilium auratum.

As this year's shipments have now arrived from Japan, WILLIAM GORDON begs to call attention to the following reduced prices:—sises: No. 1, 6d.; No. 2, 9d.; No. 3, 1s.; and splendid bulbs, 1s. 6d. each. Sampling orders are supplied only in the following quantities, and are carefully packed in tin boxes to contain only the following number of bulbs, the prices quoted including carriage to any part of the United Kingdom:—2 bulbs, 6d. extra; 4 bulbs, 1s. 6d.; 8 bulbs, 2s. 7d. bulbs, 2s. 6d., added to the foregoing prices. Quantities of 12 bulbs and over package and carriage free, less 10 per cent. discount. LILY LIST on application. WILLIAM GORDON, Lily, Bulb, and Plant Importer, 10, Cullum Street, London, E.C. Post-office Orders payable at Fenchurch Street, E.C.

AVENUE TREES.

PLANE TREES.—Several thousands of the true Platanus occidentalis, from 10 to 20 feet high, straight stemmed, stout, and splendidly rooted.

LIMES, 10 to 20 feet high.

POPLAR, canadensis nova, 12 to 20 feet high.

These Trees have been grown expressly for Street and Avenue Planting.

They are to be seen growing at Knap Hill, and are, without question, the finest stock of their kinds to be found in any Nursery in Europe.

ANTHONY WATERER, KNAP HILL, WOKING, SURREY.

WM. PAUL & SON,

(Successors to the late A. Paul & Son, Established 1806.)

Delivered on rail at Blackwater, South-Eastern Railway, or Farnborough, South-Western Railway, by the truck-load. Cash with order.

HOLDER AND SON, Crown Nurseries, Reading.

Beautiful Flowers and Luscious Fruit.

WILLS' ELIXIR.—This Manure produces the most marvellous and enduring effects on all kinds of Fruits grown under glass, such as Vines, Peaches, Strawberries, Melons, Cucumbers, and all kinds of Flowering and Foliage Plants. It is equally effective when applied to Fruits and Flowers growing in the open air. It is very light, 1 cwt. being equal to 6 cwt. of any other manure; it is also free from all objectionable smells.

"Judging by the results seen in the growth of Vines and Strawberries in pots at HECKFIELD, the BUFFALO-HORN MANURE must possess most valuable manurial properties. The Strawberry Plants being limited in root-space, perhaps offer the most forcible illustration of its value, as these in small 2½'s are most exceptionally robust, the crowns large, and the foliage of a deep green hue. A moderate portion of the Manure mixed with the soil proves to be a singularly valuable constituent."—Vide GARDENERS' CHRONICLE, December 8, 1877.

Royal Horticultural Gardens.

Chiswick, August 14, 1877.

"DEAR SIR,—No manure that we have ever used here has produced results so decided—so apparent and satisfactory. I therefore consider the Elixir to be the most efficient of manures, and intend to use it largely.—I am, dear Sir, yours very truly."

Mr. J. WILLS. A. F. BARRON.

Numerous other testimonials may be had on application.

Sold in Bags at 1s. 6d., 2s. 6d., 5s., and 10s. 6d. each; or by the cwt., £s. 4s.

JOHN WILLS, Royal Exotic Nursery, Onslow Crescent, South Kensington, London, S.W.

JAS. T. ANDERSON, 149, Commercial Street, Shoreditch, London, E.C.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of Plain or more elaborate designs, with prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truck-load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Horticultural Pottery, Bristol. W. MAULE AND SONS are now manufacturing, for Spring Delivery, a cheap and useful size POT for Bedding and other Plants. LONG and SHORT TOMS, 2s. 6d. and 2s. 1d. per 100. The Trade supplied. Illustrations and General Prices sent free on application.

A large variety of sizes, 15-oz., 12s. 6d.; 21-oz., 16s. 6d. per 100 feet. Large sizes, in Cases, for Cutting up—15-oz. 4ths, 36s.; 21s. 4d. per 300 feet; 21-oz. 4ths, 36s.; 30s., 46s. per 200 feet.—ALFRED SVER, Glass, Lead, Zinc, Oil and Colour Merchant, 8, Pentonville Road, London, N.

Silver Medal, 1874.

THE TERMINAL SADDLE BOILER.—First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—Gardener's Magazine, p. 254. "I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—Journal of Horticulture, p. 327. "For moderate cost and real efficiency the Terminal Saddle is one of the very best."—The Gardener, p. 95.

Prospectus post free.

T. JONES, Temple Street, Manchester.

PATENT PORTABLE SMOKELESS STOVES and PATENT FUEL.

For Heating Conservatories, Greenhouses, Halls, Shops, and Places without Chimneys. The Stoves burn with one supply of Fuel 12 to 24 hours, requiring no attention or re-filling. NASH'S PATENT PORTABLE VAPOUR BATH and BRONCHITIS KETTLES, with Medical Testimonials. Firework and Carving Tools, Saw Frames, Saws, Patterns, and Prepared Wood, &c.

S. NASH, Tool Warehouse, 119, Newgate Street, E.C., and 253, Oxford Street, London, W. Prospectus free.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0

24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

AGRICULTURAL LOCOMOTIVES, STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers,

AVELING & PORTER, ROCHESTER, KENT; 72, CANNON ST., LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.

"Royal Exotic Nursery, King's Road, Chelsea, S.W.—Aug. 8, 1877. 'GENTLEMEN.—In reply to your enquiry as to our opinion of your Stevens' Trentham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Trentham Boiler, and we have now thirteen of various sizes at work. 'For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Trentham Boilers supplied by you, and we have never felt so little anxiety in connection with our hot-houses during the cold winter months as we do now. 'We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion. 'We are, Gentlemen, yours faithfully, 'JAMES VEITCH AND SONS."

For Illustrations, with full particulars, apply to the Sole Makers, F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

For Illustrations, with full particulars, apply to the Sole Makers, F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

Plans and Estimates of Work in any part of the Kingdom grates, and efficiency guaranteed. Price Lists, Prospectus, and Testimonials free on application.

THOS. WOLSTENCROFT AND CO., 46, Ludgate Hill, London, E.C.

J. G. WAGSTAFF, Albert Ironworks, Dukinfield.

GEORGE'S PATENT CALORIGEN,

FOR Warming and Ventilating Small Conservatories.

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory. Made in Wrought Iron, £3 3s. Made in Copper, £5. Height, 28 inches; diameter, 14 inches. It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).

Illustrated Prospectuses and Testimonials on application. J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C.

This Stove introduces a strong current of warmed (not burnt) fresh air.

PAXTON PATENT SOLID CAST STEEL GARDEN and FIELD TOOLS. Made from one solid piece of cast steel, and carefully tempered.

In Sets as above, well finished, for Gardeners, 17s. per set.

In Sets as above, Polished and Japanned, for Amateurs, 20s. per set.

Manufactured by SPEAR AND JACKSON, Etna Works, Sheffield, and Sold by all Ironmongers and Seedsmen.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1872, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 100 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners! This was THE CHAMPION, Deards' Patent Close-Coil Boiler, for Drawings and Prices of which send two stamps to Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WOODRICK, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

ADVERTISERS are requested to note that although we do not object to receive Letters to be called for, we cannot undertake to forward them.

WANTED, an energetic Young MAN, to take charge, under Foreman, of Bedding and Herbaceous Plants.—State wages required and experience, to GEORGE COOLING, Nurseryman, Bath.

WANTED, a MAN of experience, who understands Grape and Fruit Growing for Market, and to make himself useful in a Nursery. Those only who know their business, not who think they know, are requested to reply to this.—Bag 20, Post-office, Baintree.

To the Seed Trade.
WANTED, a SHOPMAN, for the North of Ireland—one well accustomed to Retail Counter Trade, with a knowledge of Book-keeping; would be expected to make himself generally useful.—State previous experience and salary expected, to R., care of Hurst & Son, 6, Leadenhall Street, London, E.C.

WANTED, a SHOPMAN, accustomed to a Counter Trade.—Address application, stating salary, experience, and age, BARR AND SUGDEN, 12, King Street, Covent Garden, W.C.

Retail Seed Trade.
WANTED, a JUNIOR ASSISTANT, with five or six years' experience, for the Warehouse, and to assist at the Counter. Character must bear strict investigation. Applicants must state experience, salary expected, with reference to last employer.—W. TAIT AND CO., 45, Capel Street, Dublin.

WANTED, a thoroughly competent INVOICE CLERK.—Apply, stating where last employed, wages, age, &c., to CRANSTON AND CO., King's Acre Nurseries, Hereford.

WANTED, an intelligent, respectable young MAN, who has had some experience in the Retail Seed Trade.—State age, reference, wages, &c., to CRANSTON AND CO., Hereford.

WANTED, a Youth, as ASSISTANT and IMPROVER in the Seed Trade. Must write a good hand and produce unexceptionable references.—THOMAS WHALLEY, 12, St. George's Crescent, Liverpool.

WANT PLACES.

Head Gardeners.
JOHN LAING AND CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

E. G. HENDERSON
 AND SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for re-engagement.
 E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him; as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

GARDENER (HEAD).—Age 29, single; fourteen years' experience. Five years in last situation. Death cause of leaving. First-class reference.—G. BOLTON, Burston, Diss, Norfolk.

GARDENER, (HEAD).—Age 27, single; W. BEALE, Gardener to the late Baron Hambro, can highly recommend his Foreman as Head Gardener to any Lady or Gentleman requiring a really good Man.—For particulars apply to W. BEALE, The Gardens, Milton Abbey, Blandford, Dorset.

To Noblemen and Gentlemen.
GARDENER (HEAD), where a thoroughly practical, trustworthy Man is required.—Age 40, married, no family; thoroughly experienced in every branch of the profession, and can be highly recommended from last and previous employers.—R. H., 50, Waterford Road, Fulham, S.W.

To Market Growers and Others.
GARDENER (HEAD).—Aged 40, married, no family; thoroughly understands Gardening in all its branches, and especially Fruit-culture, and Growing for Covent Garden. Would be invaluable in a private place where the surplus is disposed of. Four years' excellent character.—J. G., 7, Cambridge Cottages, Lower Teddington.

GARDENER (HEAD, WORKING).—Age 33, married; thoroughly practical in all branches of the profession. Good character from present and previous employers.—GARDENER, Northfleet House, Northfleet, Kent.

GARDENER (HEAD, WORKING).—Age 28, married; fourteen years' experience in all branches. First-class reference from present and previous places.—J. SCOTT, Thornby Court, Leicester.

GARDENER (HEAD, WORKING).—Age 35, widower, no family; thoroughly understands every branch of the profession. Highly recommended.—Address full particulars to J. ARCHER, 12, Turner Road, Lee, Kent.

GARDENER.—WM. HINDS, Gardener to Sir Thomas Edwards-Moss, Bart., Otterspool, near Liverpool, can with every confidence recommend a Man who is thoroughly experienced in all branches of the profession, and who has acted in a similar capacity in a first-rate establishment.

GARDENER (UNDER).—Age 21. Good character from last place.—F. D., Lupton Gardens, Brixham.

GARDENER (UNDER).—Age 21; seven years in good places, experienced in the various departments. Can be well recommended from last and previous places.—J. S., Somerleyton, Lowestoft.

GARDENER (UNDER), in a large Establishment, in the Houses.—Age 20. Good character.—W. SMITH, Mr. G. Maunder, Seatoo Carew, West Hartlepool.

GARDENER (UNDER), under the Foreman, in the Houses. Twelve months' character. Bothy preferred.—A. P., Arthur's Cottages, Star Row, near Horsham, Sussex.

GARDENER (UNDER), in the Houses.—Understands the Management of Vines, Peaches, Stove and Greenhouse Plants. Three years' character.—T. W. DENNIS, Dene Street, Dorking.

GARDENER (UNDER), or IMPROVER.—Age 21; five years' experience. Good references.—WILLIAM BOX, Turville Heath, Henley-on-Thames, Oxon.

GARDENER and BAILIFF.—The Advertiser, having acted in the above capacity over eight years to Sir A. Palmer, Bart., will shortly be disengaged, and offers his services to any Nobleman or Gentleman requiring a thorough practical, trustworthy Man; a good Accountant.—Apply, in first instance, to WILLIAM STONE, Wanlip, near Leicester.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 26; well up in the profession. Eleven years' experience. Good character.—J. S., Mr. Newberry, Bletchingley Common, Surrey.

FOREMAN, under a Landscape Gardener.—Age 28, single.—CHARLES TROMMER, Downie & Laird, 17, Frederick Street, Edinburgh.

JOURNEYMAN, in a good Establishment. Age 21. Good character.—E. The Gardens, Worksp Manor, Nottinghamshire.

PROPAGATOR (UNDER, or as ASSISTANT).—Age 24; good experience and character.—J. J., Frant Bottom Lodge, Tunbridge Wells, Kent.

IMPROVER, in the Houses preferred.—Age 20. Good references.—Apply, stating full particulars, to H. GAUT, Gardener, The Elms, Chelmsford, Essex.

MANAGER, or GENERAL FOREMAN in a first-class Business.—Age 37; twenty-one years' experience. First-class references.—X., 1, Nelson Grove, Merton, S.W.

AGENT in LONDON (Agri-Horticultural).—The Advertiser, who has had many years' experience among the leading English and Continental Houses connected with the above, and who has during the past seven years transacted the London Business of a well-known Provincial firm recently the London Next, is open to arrange with another House of good standing in a similar capacity, either at his present office, situate in the very centre of the City, or elsewhere, or would accept Resident Country Agency of House or Landed Property, and give accurate returns of all receipts and disbursements pertaining thereto. Unexceptionable references given and required.—CURATOR, *Gardeners' Chronicle* Office, W.C.

CLERK, or SHOPMAN and CLERK.—Young; several years' experience; thoroughly understands both Nursery and Seed Trade; a good Correspondent and Book-keeper.—B. R., Mr. Jones, 12, Allen's Buildings, Leonard Street, Finsbury, London, E.C.

CLERK.—A German Gentleman, age 25, nine months in England, is seeking a situation in a Seedsman's Office; is well acquainted with this trade on the Continent, and with Book-keeping by single and double entry; understands a little Shorthand and French. Highest testimonials and references in England.—Mr. AUG. REICH, 119, London Road, Macclesfield.

GRATEFUL—COMFORTING.

 HOMŒOPATHIC CHEMISTS.

KINAHAN'S LL WHISKY.
 The cream of old Irish Whiskies. Pure, mild, mellow, delicious and most wholesome. Universally recommended by the Medical Profession. Dr. Hasall says, "The Whisky is soft mellow and pure, well matured, and of very excellent quality."—20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.
 The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.
 DINNEFORD AND CO.,
 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT and PILLS.
 Few persons are so favoured by circumstances or so fortified by Nature as to enable them to pass unscathed the sore trials of an inclement season. With catarrhs, coughs, and influenza everywhere abounding, it should be universally known that Holloway's Ointment, diligently rubbed upon the chest, checks the worst assaults of these maladies, and securely wards off more grave and dangerous diseases of the throat and lungs. The truth of this assertion must remain unquestioned in the face of thousands of unimpeachable living witnesses, who have personally derived the utmost possible benefits from this treatment when their present sufferings were appalling, and their future prospects most disheartening. Both remedies act admirably together.

Send for a **PRICE LIST** of
**BLAKE'S SELF-ACTING
HYDRAULIC RAMS,**

For Raising Water for the Supply of
Villages, Irrigation, Railway Stations, Mansions,
Fountains, Farms.

No Cost for Motive Power, which is obtained from the
Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 100,000 Gallons per day.

WILL FORCE TO A HEIGHT OF 1,500 FEET.

This advertisement will
appear again in three weeks.

This Ram will raise a part of the same water that works it, or will raise pure water from a well whilst it is worked by a stream of impure water.

TESTIMONIALS.

From the Right Hon. T. SOTHERN ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*

"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful."

(The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

From Captain TOWNSHEND, *Wincham, February 10, 1877.*

"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000."

From JOHN BARNES, Esq., *Contractor, Chatham and Hellsfield Railway, Contractor's Office, March, 1877.*

"Dear Sir,—I have the pleasure to inform you that the three Hydraulic Rams you erected for me on this contract about two years ago, have continued to work very satisfactorily, without requiring any repairing. With a fall of 5 feet sufficient water has been raised daily by each Ram to supply two of my locomotive engines: they have fully answered my expectations and all that has been said of them."

Deanwater, Wilmslow, November 20, 1873.

"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required, namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—I am, yours truly, L. HANMER."

From Mr. THOMAS MASON, *Alkincoates Hall, Colne, September 30, 1871.*

"Sir,—Your self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours to a height of 194 feet."

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne, December 21, 1868.*

"Sir,—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

**JOHN BLAKE,
ENGINEER, ACCRINGTON.**
